Sec 1

Direction for questions (1-4): Read the given passage and answer the questions that follow.

Having more folds in this part of the brain is important because those folds increase the surface area available for brain cells, or neurons, without making the brain too big for the skull. Demonstrating that the human gene fulfills a similar purpose in the brain of another primate provides new insight into how humans may have evolved and may point the way to future treatments for brain disease.

“The human-specific sequence of new B is absolutely essential for the ability of the gene to amplify the relevant brain stem cells in development,” says Wieland Huttner of the Max Planck Institute of Molecular Cell Biology, one of the study’s authors.

Previous studies showed similar effects in mice and ferrets modified to have the new *B* gene. However, using those animal models meant the gene was not necessarily expressed in the same way it is in humans. Study author Michael Heide, also of the Max Planck Institute, says the team wanted to study a model organism closely related to humans, and the two most practical options were the marmoset and the macaque.

“We thought that the marmoset would be the better model because the macaque neocortex has many features that it shares with our big and folded neocortex. However, the marmoset is smooth and very small in size.” Thus, any changes to the size and shape of the marmoset neocortex would be easy to see.

To introduce the gene into monkey embryos, the researchers used a “lentivirus,” a virus carrier that cannot replicate. The lentivirus contained *ARHGAP11B* as well as a protein marker that would allow the researchers to see where that gene was expressed. They included a promoter gene, or a DNA sequence that regulates expression of specific genes.

Debra Silver, an investigator at the Duke University Institute for Brain Sciences, says the researchers’ methods in this study, improved from those used with mice and ferrets, lend a lot of weight to the significance of the results. “One of the challenges [for this kind of study] is you can have abnormally high levels [of expression]. It’s like taking a Mack truck to drive something versus something subtler like a Toyota. The idea is, with this they’re trying to get closer to what would be normally expressed in the human brain.”

“We have a whole list of genes that we think might be important in what makes us uniquely human, but very rarely have we definitively shown that they actually are contributors,” Dennis says. “And I have to say that a study like this really brings *ARHGAP11B* up to the top of the list as a gene that could very well be important in human brain development.”

Q.1 [11594329]

Why did the researchers prefer a marmoset over a macaque for the study?

-
- 1 ☐ Marmoset is a smooth and tiny creature as opposed to macaque.
-
- 2 ☐ Marmoset neocortex more closely resembles the folded human neocortex than macaque neocortex does.
-
- 3 ☐ It is easier to observe changes to the size and shape of a marmoset neocortex as compared to a macaque neocortex.
-
- 4 ☐ The gene expresses itself better in the neocortex of a marmoset than in the neocortex of a macaque.
-

Direction for questions (1-4): Read the given passage and answer the questions that follow.

Having more folds in this part of the brain is important because those folds increase the surface area available for brain cells, or neurons, without making the brain too big for the skull. Demonstrating that the human gene fulfills a similar purpose in the brain of another primate provides new insight into how humans may have evolved and may point the way to future treatments for brain disease.

“The human-specific sequence of new B is absolutely essential for the ability of the gene to amplify the relevant brain stem cells in development,” says Wieland Huttner of the Max Planck Institute of Molecular Cell Biology, one of the study’s authors.

Previous studies showed similar effects in mice and ferrets modified to have the new *B* gene. However, using those animal models meant the gene was not necessarily expressed in the same way it is in humans. Study author Michael Heide, also of the Max Planck Institute, says the team wanted to study a model organism closely related to humans, and the two most practical options were the marmoset and the macaque.

“We thought that the marmoset would be the better model because the macaque neocortex has many features that it shares with our big and folded neocortex. However, the marmoset is smooth and very small in size.” Thus, any changes to the size and shape of the marmoset neocortex would be easy to see.

To introduce the gene into monkey embryos, the researchers used a “lentivirus,” a virus carrier that cannot replicate. The lentivirus contained *ARHGAP11B* as well as a protein marker that would allow the researchers to see where that gene was expressed. They included a promoter gene, or a DNA sequence that regulates expression of specific genes.

Debra Silver, an investigator at the Duke University Institute for Brain Sciences, says the researchers’ methods in this study, improved from those used with mice and ferrets, lend a lot of weight to the significance of the results. “One of the challenges [for this kind of study] is you can have abnormally high levels [of expression]. It’s like taking a Mack truck to drive something versus something subtler like a Toyota. The idea is, with this they’re trying to get closer to what would be normally expressed in the human brain.”

“We have a whole list of genes that we think might be important in what makes us uniquely human, but very rarely have we definitively shown that they actually are contributors,” Dennis says. “And I have to say that a study like this really brings *ARHGAP11B* up to the top of the list as a gene that could very well be important in human brain development.”

Q.2 [11594329]

Which of the following information, if true, would most strengthen the results of the study?

1 ☐ After the new B gene was introduced in the marmosets, it was found to control the production of certain neurons that are responsible for higher-order processing.

2 ☐ The new B gene, once introduced in the marmosets, was passed on successfully to the subsequent generations.

3 ☐ Once the new B gene was introduced, the folds in the neocortices of marmosets kept on growing as their age increased.

4 ☐ A subsequent study found another gene in the neocortex of humans, similar to new B in its structure, that helped them to plan for the future.

Direction for questions (1-4): Read the given passage and answer the questions that follow.

Having more folds in this part of the brain is important because those folds increase the surface area available for brain cells, or neurons, without making the brain too big for the skull. Demonstrating that the human gene fulfills a similar purpose in the brain of another primate provides new insight into how humans may have evolved and may point the way to future treatments for brain disease.

"The human-specific sequence of new B is absolutely essential for the ability of the gene to amplify the relevant brain stem cells in development," says Wieland Huttner of the Max Planck Institute of Molecular Cell Biology, one of the study's authors.

Previous studies showed similar effects in mice and ferrets modified to have the new *B* gene. However, using those animal models meant the gene was not necessarily expressed in the same way it is in humans. Study author Michael Heide, also of the Max Planck Institute, says the team wanted to study a model organism closely related to humans, and the two most practical options were the marmoset and the macaque.

"We thought that the marmoset would be the better model because the macaque neocortex has many features that it shares with our big and folded neocortex. However, the marmoset is smooth and very small in size." Thus, any changes to the size and shape of the marmoset neocortex would be easy to see.

To introduce the gene into monkey embryos, the researchers used a "lentivirus," a virus carrier that cannot replicate. The lentivirus contained *ARHGAP11B* as well as a protein marker that would allow the researchers to see where that gene was expressed. They included a promoter gene, or a DNA sequence that regulates expression of specific genes.

Debra Silver, an investigator at the Duke University Institute for Brain Sciences, says the researchers' methods in this study, improved from those used with mice and ferrets, lend a lot of weight to the significance of the results. "One of the challenges [for this kind of study] is you can have abnormally high levels [of expression]. It's like taking a Mack truck to drive something versus something subtler like a Toyota. The idea is, with this they're trying to get closer to what would be normally expressed in the human brain."

"We have a whole list of genes that we think might be important in what makes us uniquely human, but very rarely have we definitively shown that they actually are contributors," Dennis says. "And I have to say that a study like this really brings *ARHGAP11B* up to the top of the list as a gene that could very well be important in human brain development."

Q.3 [11594329]

Why does Debra Silver say "It's like taking a Mack truck to drive something versus something subtler like a Toyota."?

-
- 1 ☐ To highlight the difference in the intensity and thus the experience of driving the two vehicles.
-
- 2 ☐ Because for Debra Silver, Mack Truck symbolizes abnormally high levels of gene expression whereas Toyota symbolizes normal levels of gene expression.
-
- 3 ☐ To assert through an analogy that by choosing marmosets, the study was able to get a level of gene expression that was closer to that in humans.
-

4 ○ To state that the research methodology of the study under discussion lends a lot of weight to the significance of its results.

Direction for questions (1-4): Read the given passage and answer the questions that follow.

Having more folds in this part of the brain is important because those folds increase the surface area available for brain cells, or neurons, without making the brain too big for the skull. Demonstrating that the human gene fulfills a similar purpose in the brain of another primate provides new insight into how humans may have evolved and may point the way to future treatments for brain disease.

“The human-specific sequence of new B is absolutely essential for the ability of the gene to amplify the relevant brain stem cells in development,” says Wieland Huttner of the Max Planck Institute of Molecular Cell Biology, one of the study’s authors.

Previous studies showed similar effects in mice and ferrets modified to have the new *B* gene. However, using those animal models meant the gene was not necessarily expressed in the same way it is in humans. Study author Michael Heide, also of the Max Planck Institute, says the team wanted to study a model organism closely related to humans, and the two most practical options were the marmoset and the macaque.

“We thought that the marmoset would be the better model because the macaque neocortex has many features that it shares with our big and folded neocortex. However, the marmoset is smooth and very small in size.” Thus, any changes to the size and shape of the marmoset neocortex would be easy to see.

To introduce the gene into monkey embryos, the researchers used a “lentivirus,” a virus carrier that cannot replicate. The lentivirus contained *ARHGAP11B* as well as a protein marker that would allow the researchers to see where that gene was expressed. They included a promoter gene, or a DNA sequence that regulates expression of specific genes.

Debra Silver, an investigator at the Duke University Institute for Brain Sciences, says the researchers’ methods in this study, improved from those used with mice and ferrets, lend a lot of weight to the significance of the results. “One of the challenges [for this kind of study] is you can have abnormally high levels [of expression]. It’s like taking a Mack truck to drive something versus something subtler like a Toyota. The idea is, with this they’re trying to get closer to what would be normally expressed in the human brain.”

“We have a whole list of genes that we think might be important in what makes us uniquely human, but very rarely have we definitively shown that they actually are contributors,” Dennis says. “And I have to say that a study like this really brings *ARHGAP11B* up to the top of the list as a gene that could very well be important in human brain development.”

Q.4 [11594329]

Which of the following are the critics of the study most likely to cite to attack its results?

- 1 ☐ In very rare cases, it has been found that the lentivirus used by researchers can replicate and mutate.
- 2 ☐ In the studies on mice and ferrets, the new B gene was expressed in exactly the same way as that in humans.
- 3 ☐ The promoter gene used by the researchers was significantly responsible for the increase in the folds in the brain of marmosets.
- 4 ☐ Because a macaque's brain is very closely related to the human brain, new B expresses itself in macaque's brain in an almost the same manner as that in humans.

Direction for questions (5-9): Read the given passage and answer the questions that follow.

Editors at *Merriam-Webster* are working on a revision of the definition of *racism*. So, the Great Awakening is even going so far as to change the dictionary? Not quite—sociopolitics drew the usage of the word *racism* beyond the dictionary definition long ago, and it is high time our dictionaries got the message.

LIKE OTHERS, THE *Merriam-Webster* dictionary has, up to now, given us what we might consider the 1.0 definition of *racism*, the one we would cite for the curious child. That is, what used to be referred to as *prejudiced*: “a belief that race is the primary determinant of human traits and capacities and that racial differences produce an inherent superiority of a particular race.”

Since the 1960s, however, *racism* has often been used in terms such as *societal racism* and *institutional racism*, referring to structures of society that disadvantage people of subordinated races because of the collective effect of bigoted attitudes. So one might say that societal racism is to blame for neighborhoods with decaying infrastructure, because white flight lowered tax revenues.

These terms have naturally often been shortened to just *racism*, such that the word has acquired a 2.0 definition. *Merriam-Webster* captures this as well, noting that *racism* can mean “a political or social system founded on racism.”

However, Kennedy Mitchum, 22 and just out of college, wrote a message to the editors at *Merriam-Webster* asking them to expand the definition to account for usage that has morphed even beyond the 2.0 definition to refer to “social and institutional power.” Mitchum noted that racism “is a system of advantage based on skin color.”

Here, the focus of the definition is less on attitudes than results: The societal disparities between white people and others are themselves referred to as racism, as a kind of shorthand for the attitudinal racism *creating* the disparities. MITCHUM WAS FRUSTRATED by people telling her, in debates about racism, that her 3.0 definition was erroneous given that it wasn’t “what’s in the dictionary.” Her frustration was justified. She wasn’t creating her own definition of the word—it is shared by legions of people, especially educated ones, across our nation.

Dictionaries can lag behind societal developments, and the idea that a “word” indisputably “means” what dictionaries say is simply sloppy. Words’ meanings change inevitably and constantly, and not just in terms of slang. As such, it won’t do for definitions of words as crucial as *racism* to keep sitting somewhere around the era of Watergate and fondue.

To extend a word’s definition from a personal quality to a society is, in itself, hardly unusual. The progression of *racism* 1.0 to *racism* 2.0 follows a line of metaphorical reasoning common as far back as the Greek philosophers treating societies as individuals in macrocosm. The conceptual step between a healthy person and a healthy society is a short one, as is that between a racist person and a racist society.

But the step is only short when the idea is still that discrimination, standing at the gate, is the essence of racism. The progression from *racism* 2.0 to *racism* 3.0 is less typical as language change goes. The 3.0 usage implies that calling racial disparities “racism” is natural because it is indisputable that racial disparities stem from bias-infused barriers.

Q.5 [11594329]

Which of the following is the author most likely to agree with?

1 ☐ Merriam Webster's revision of its definition of racism symbolizes the 'Great Awakening' going far into the realm of linguistics.

2 ☐ There is a difference between societal and institutional racism and social and institutional power.

3 ☐ Dictionaries tend to lag behind societal developments.

4 ☐ The definition of racism proposed by Kennedy Mitchum is already used by everyone.

The progression from *racism* 2.0 to *racism* 3.0 is less typical as language change goes. The 3.0 usage implies that calling racial disparities “racism” is natural because it is indisputable that racial disparities stem from bias-infused barriers.

Q.6 [11594329]

According to the passage which of the following is true?

-
- 1 ☐ Greek philosophers treated the society as the whole of a structure of which individuals were a part.
-
- 2 ☐ Kennedy Mitchum was frustrated because people were accusing her of being unoriginal in her definition.
-
- 3 ☐ It is incontestable that racial disparities arise from bias-infused barriers.
-
- 4 ☐ Racism is a system of advantage based on skin color.

The conceptual step between a healthy person and a healthy society is a short one, as is that between a racist person and a racist society.

But the step is only short when the idea is still that discrimination, standing at the gate, is the essence of racism. The progression from *racism* 2.0 to *racism* 3.0 is less typical as language change goes. The 3.0 usage implies that calling racial disparities “racism” is natural because it is indisputable that racial disparities stem from bias-infused barriers.

Q.8 [11594329]

Which of the following best captures the essence of the sentence "The conceptual step between a healthy person and a healthy society is a short one, as is that between a racist person and a racist society."?

- 1 ☐ A society and its individuals are closely entwined in terms of their health conditions and racist attitudes, so it is reasonable to infer about one by looking at the other.
- 2 ☐ As individuals make up a society, it is reasonable to conclude that the conditions and attitudes of the influential among them extend to become those of the whole society.
- 3 ☐ As a society is a collection of individuals, it is reasonable to extend the health conditions or racist attitudes of the society to its individuals.
- 4 ☐ As individuals are a representative part of a society, it is reasonable to extend the condition or attitudes of its individuals to the society as a whole.

The 3.0 usage implies that calling racial disparities “racism” is natural because it is indisputable that racial disparities stem from bias-infused barriers.

Q.9 [11594329]

What is the role played by the sentence "So one might say that societal racism is to blame for neighborhoods with decaying infrastructure, because white flight lowered tax revenues."?

- 1 ☐ It is an opinion with which the author does not agree as it places the blame for the present condition of a neighbourhood on white people who no longer live there.
- 2 ☐ It serves to explain societal racism as a practice by which one section of the society deemed superior can create structures that collectively disadvantage another section.
- 3 ☐ It illustrates how collective prejudice towards the races considered inferior results in societal structures that handicap them.
- 4 ☐ It serves to exemplify the ghettoization of subordinated races as a result of societal structures which exhibit collective bigoted attitudes towards them.

Direction for questions (10-14): Read the given passage and answer the questions that follow.

What will economic recovery in the face of Coronavirus look like? At this fraught moment, no one knows enough about consumer sentiment and government ordinances and business failures and stimulus packages and the spread of the disease to make solid predictions about the future. The Trump administration and some bullish financial forecasters are arguing that we will end up with a strong, V-shaped rebound, with economic activity surging right back to where it was in no time. Others are betting on a longer, slower, U-shaped turnaround, with the pain extending for a year or three. Still others are sketching out a kind of flaccid check mark, its long tail sagging torpid into the future.

Faced with the historic catastrophe, the United States marshalled a historic response: Republicans in the White House and Congress, generally hostile to the notion of economic stimulus for low-income households, came together with Democrats to achieve a \$2 trillion rescue package, including a \$1,200 onetime payment for most adults and \$500 for many children, a radical expansion of the unemployment-insurance system to include gig workers, and a \$600-a-week bump to unemployment-insurance payouts. It also created a sweeping small-business rescue plan, covering payroll for companies that kept their employees on the books.

The good: This money kept families afloat—at least for the first, intense months of shelter-in-place. New estimates suggest that the Congressional rescue plan prevented poverty rates from rising, with many jobless workers seeing their incomes increase during lockdown due to the expanded unemployment-insurance payouts. The bad: It left out roughly 15 million people in immigrant families, many of whom were working essential jobs stocking grocery shelves, delivering takeout, and drawing blood in hospitals. And the ugly: The big helicopter drop was a onetime thing, and the unemployment-insurance expansion was time-limited. Congress designed Uncle Sam's help to dry up this summer, with the unemployment rate still in the double digits. Democrats and Republicans are negotiating another stimulus bill, but concerns about surging budget deficits are complicating the talks.

That means households are headed for a cliff. But not everyone will be affected by it equally. Rich workers, the ones with do-anywhere office jobs, have remained relatively untouched by job and earnings losses thus far. Wealthy families have seen their stock portfolios rebound to close to where they were in the winter. But poor workers—disproportionately black and Latino workers, as well as younger workers—have borne the heaviest employment and earnings losses. They entered this recession with no wealth cushion, many saddled with heavy rents and heavy debts. Income and job losses for them translate into a loss of demand economy-wide, absent federal intervention.

If and when that federal intervention dries up, millions of families just keeping their head above water will sink, as lost jobs and cancelled hours force them to stop paying their rent and go into arrears on their debt payments. Hunger, homelessness, forgotten plans to attend community college, babies growing up in stressed households: These are the stakes. The CBO forecasts that every quarter through the end of 2021, American consumers will buy \$300 billion to \$370 billion less than they would have if the pandemic had never happened. [...]

Q.10 [11594329]

Based on Para 1, which of the following appears to be the most miserable prediction about the future of the economy?

1 ☐ A strong V-shaped rebound

2 ☐ A flaccid check mark

3 ☐ A U-shaped turnaround

4 ☐ Both 2 and 3 are equally miserable.

Q.11 [11594329]

What does the word 'cliff' as used in Para 4 imply?

-
- 1 ☐ A financial crossroads that will require the households to make tough decisions.
-
- 2 ☐ A financial fall that will not affect all households equally, with the rich and do-anywhere job holders likely to be cushioned.
-

3 ☐ A financially hazardous situation affecting households unevenly.

4 ☐ A financial roadblock that would not affect all households in the same way, with the rich and do-anywhere job holders probably navigating it.

Q.12 [11594329]

Which of the following, if true, would most weaken the argument mainly presented by the author in the last paragraph?

- 1 ☐ The author, instead of appealing to logic, tries to appeal to the emotion of the reader by painting a miserable picture of hunger, homelessness, stressed households, etc.

2 ☐ The CBO is known to take the most bearish scenario while making its forecasts and the real decrease in spending may be less.

3 ☐ The federal stimulus being negotiated is focused on measures for considerable job creation and continual monetary payments to the affected households till such jobs are created.

4 ☐ The poor households should re-skill or up-skill themselves, so that they can find alternative jobs to pay their rent and debt.

Q.13 [11594329]

From the passage, all of the following can be inferred EXCEPT:

-
- 1 ☐ The term 'Uncle Sam' refers to the US federal government.
-
- 2 ☐ Even though the unknown variables in the current pandemic situation make it difficult to make concrete predictions about the future, some predictions are being made.
-

3 ☐ Immigrant families in the US primarily work in jobs such as grocery stockers, takeout delivery personnel, and frontline hospital staff.

4 ☐ The term 'helicopter drop' has been used metaphorically in the passage to refer to the monetary stimulus.

Direction for questions (15-18): Read the given passage and answer the questions that follow.

Winston Churchill famously called Indians “a beastly people with a beastly religion who bred like rabbits”.

Madhushree Mukerjee’s Churchill’s Secret War establishes how Churchill and his associates could easily have stopped the Bengal famine of 1943 with a few shipments of food grains but refused, in spite of repeated appeals from two successive Viceroys, Churchill’s own Secretary of State for India and even the President of the United States.

Famines, never unknown in India, became increasingly lethal during the Raj because of the export of food grains and the replacement of food crops with indigo or jute. The Second World War made things worse, especially after Japanese forces occupied Burma in 1942, cutting off Indian rice imports. Then a destructive cyclone hit the Bengal coast just when the crucial winter crop was maturing, and the surviving rice was damaged by disease. Officials of the Raj, fearing a Japanese invasion, confiscated everything that might help the invading force – boats, carts, motor vehicles, elephants and, crucially, all the rice available. The Japanese never came but a panicking public – and many crafty businessmen – immediately began to hoard rice and the staple food of the people quickly disappeared from the marketplace.

Government stocks were released but only to feed the people of Calcutta and the urban population never suffered too greatly. The rural masses, however, were left to the wolves. This was when Churchill could have made a difference by sending wheat or rice to Bengal, and not enormous quantities. The point was to make hoarding unprofitable and as the Viceroy Lord Linlithgow pointed out, “the mere knowledge of impending imports” would have done so by lowering the price of rice.

Churchill and his war cabinet, however, decided to reserve available shipping to take food to Italy in case it fell to the Allies. He even refused help from Subhas Chandra Bose, then fighting with Axis forces, and also from Australia and Canada.

So, hundreds of thousands perished in the villages of Bengal. In London, Churchill’s beloved advisor, the physicist Frederick Alexander Lindemann (Lord Cherwell), was unmoved. A firm believer in Malthusian population theory, he blamed Indian philoprogenitiveness for the famine – sending more food would worsen the situation by encouraging Indians to breed more. The prime minister was of the same opinion and expressed himself so colourfully that Leo Amery, Secretary of State for India, exploded at him, comparing his attitudes to Hitler’s.

The Churchill industry has always denied that their idol could have done anything to relieve the Bengal famine. Shipping, they claim, was scarce and it just wasn’t possible to send food to Bengal. Mukerjee nails those “terminological inexactitudes” with precision. There was a shipping glut in summer and autumn 1943, thanks to the US transferring cargo ships to British control. Churchill, Lindemann and their close associates simply did not consider Indian lives worth saving. [...]

Q.15 [11594329]

According to the passage, what led to the hoarding of rice in India?

-
- 1 ☐ The fear of a Japanese invasion as Japanese had already invaded Burma in 1942
-
- 2 ☐ The destructive cyclone that hit the Bengal coast and the resulting damage of rice by disease.
-

3 ☐ The cutting off of Indian rice imports due to the Japanese invasion of Burma

4 ☐ Panic buying by public due to the confiscation of the available rice in Bengal by Raj officials.

Q.16 [11594329]

Which of the following situations is the most similar to the one mentioned in the last sentence of Para 4 “The point was...price of rice.”?

1 ☐ Apple keeps on launching new variants of its iPhone in the market. As consumers became aware about the launch of its new variant, the price of its latest available variant fell. This latest variant was very similar to the one being launched.

2 ○ De Beers diamond cartel acquired almost all the diamond mines and charged an exorbitant price for its diamonds. Another small diamond cartel De Vera landed upon huge diamond reserves, and once this became public knowledge, the price of diamonds fell significantly in the market.

3 ○ Hearing the news of Coronavirus, some Indian traders, expecting a stock market crash and a rush to purchase a safe asset like gold, bought gold in huge quantities. Some days into the crash, the government discovered huge gold reserves. Once this was telecast on the news, the price of gold fell.

4 ○ The share price of Reliance Industries shot up on the National Stock Exchange (NSE), but not on the Bombay Stock Exchange (BSE). The knowledge of this price difference resulted in the investors buying shares from the BSE. Eventually, the price on the NSE fell from its previous level.

Q.17 [11594329]

Based on the passage, one could best characterize Churchill as:

- 1 ☐ An arrogant racist who was known to be inspired by Hitler’s attitudes.
 - 2 ☐ An obstinate leader, who was severely prejudiced and antipathetic towards Indians.
-

3 ☐ An inconsiderate leader who, because of his fear of the Japanese invasion, made Indians suffer greatly.

4 ☐ A stubborn bigot who cared more about his political interests than about the lives of his people.

Q.18 [11594329]

Based on the passage, which of the following is the Churchill industry most likely to state to support their assertion that Churchill could not have done anything to relieve the famine?

- 1 ☐ Even if there weren’t a shortage of ships during 1943, sending food shipments to India would have certainly resulted in Churchill’s losing popular support in Britain.

2 ○ In the face of a shipping scarcity, Churchill ordered the British government in India to release vast quantities of food-grains and distribute them to rural areas as well, but that couldn't happen due to very poor accessibility to these areas.

3 ○ Even if there weren't a shipping shortage and Churchill had sent food-grains to India, the Japanese would have definitely attacked India and Bengal would have been the first one to be enslaved by them.

4 ○ If it had not been for Churchill's efforts, the casualties of the famine would have been far more than they turned out to be.

Q.19 [11594329]

Directions for question (19): The four sentences (labelled 1, 2, 3, and 4) given in this question, when properly sequenced, form a coherent paragraph. Decide on the proper order for the sentences and key in this sequence of four numbers as your answer.

1. The aphorism both resists and invites fuller articulations, and so hermeneutics – a conduit between the text and the reader – is demanded from every reader.
2. The nature of Heraclitus' microform is true for the aphorism in general.
3. They are antithetical because they are too enigmatic, and propaedeutic because they cannot but prompt us to think about the origins and nature of things.
4. Fragments are both *antithetical* and *propaedeutic* to argumentative philosophy.

Q.20 [11594329]

Directions for question (20): The four sentences (labelled 1, 2, 3, and 4) given in this question, when properly sequenced, form a coherent paragraph. Decide on the proper order for the sentences and key in this sequence of four numbers as your answer.

1. Until 200 years ago the notion of loneliness barely existed.
2. In 2018, the first British Minister for Loneliness was appointed, and the government published *A Connected Society*.
3. The histories detailed in Vincent and Bound Alberti's books reveal what a striking development this is.
4. In the preface, the country's then prime minister Theresa May referred to research that "shows that loneliness is as damaging to our physical health as smoking".

Directions for question (21): The passage given below is followed by four summaries. Choose the option that best captures the author's position.

Each of the sciences concerns itself with a particular set of things that exist – and nothing more. And here's where things become highly disputable. Heidegger asks: But what about this 'nothing'? Is it only an accident we speak like that quite naturally? Is it only a manner of speaking – and nothing more?

This slightly mad query launches Heidegger into a discussion of the Nothing. 'If science is right then one thing stands firm: science wishes to know nothing of Nothing,' he writes. That is, the objects of scientific enquiry, whatever they are, are the only things that the scientist is interested in – and nothing else. Heidegger is playing on this phrase 'nothing else' and reifying it into the Nothing.

- 1 ☐ Heidegger questions the nature of 'nothing' that the scientists are not interested in and relates it to the larger concept of Nothing in order to make it more concrete.
- 2 ☐ Heidegger relates the phrase 'nothing more' in the fact that scientists are interested only in the things that exist and nothing more to the Nothing and asserts that they are not interested in knowing about the Nothing.
- 3 ☐ Because scientists are concerned only about the things that exist and 'nothing more', Heidegger reifies this phrase to the 'Nothing' by stating that they are not interested in knowing about the things that do not exist.
- 4 ☐ Heidegger indulges in wordplay when he picks up the phrase 'nothing more' from how the scope of each of the sciences is defined and relates it to his discussion of the Nothing.

[🔍 Answer key/Solution](#)[Bookmark](#)[FeedBack](#)**Q.22 [11594329]**

Directions for question (22): Five sentences related to a topic are given below. Four of them can be put together to form a meaningful and coherent short paragraph. Identify the odd one out.

1. But there is no doubt that it often compounds the confusion as the ghosts of the past are made to walk again in a landscape that has changed profoundly.
2. For all its other virtues, comparison does not do well with the novelty that Trump certainly represents, for all of his preconditions and sources.
3. It is true that in the face of novelty, analogy with possible historical avatars is indispensable, to abate confusion and to seek orientation.
4. Yet people forget that analogy had commonly seemed noxious, not necessary, in the previous century.
5. It is no contradiction that comparing our current situation in America to fascism spares ourselves the trouble of analyzing what is really new about it.

[✕](#)[🔍 Answer key/Solution](#)[Bookmark](#)[FeedBack](#)**Q.23 [11594329]**

Directions for question (23): Five sentences related to a topic are given below. Four of them can be put together to form a meaningful and coherent short paragraph. Identify the odd one out.

1. On the other side of the Atlantic, the American Civil War saw several outbreaks among young fighting men even though they technically had never left their homeland, per se.
2. To stop the spread of the disease, Russian physicians recommended burying alive anyone who started showing symptoms—which apparently did prove quite effective.
3. Their physicians were a bit kinder, suggesting that occasional removal from front line fighting would bolster their spirits.
4. As it moved out of the medical realm and into the cultural, though, nostalgia did not fully shed its strange stigma.
5. By the 1800s, the terrors of nostalgia finally spread to various countries' soldiers.

[🔍 Answer key/Solution](#)[Bookmark](#)[FeedBack](#)**Q.24 [11594329]**

Directions for question (24): The passage given below is followed by four summaries. Choose the option that best captures the author's position.

In the New Yorker's schema, "Night Life" does not refer to clubs and parties (of little interest, apparently, to the magazine's readership) or bars (covered under "Food & Drink"). Instead, the heading serves as a euphemism for non-classical music. In the past, a classical music/nightlife dichotomy may have reflected a broader social consensus on the distinction between high and low forms. But with such distinctions murky if not altogether irrelevant today, it is hard to ignore the inherent racism: in practice, the New Yorker maintains one category for a historically white kind of music, and another category for everything else.

- 1 ☐ The way the magazine New Yorker covers all non-white music under the label "Night Life" and all white music under "Classical Music" is racist.
- 2 ☐ While New Yorker's distinction between classical music/nightlife may have reflected a consensus in the past, covering non-classical music under the label "Night Life" today is murky in the least and racist at the worst.
- 3 ☐ The way New Yorker covers all historically white kind of music—classical—in one category and other music under the label "Nightlife" might have reflected a consensus in the past, but its racism is difficult to ignore.
- 4 ☐ The New Yorker's murky practice of calling white music "Classical music" and non-white music as "Night life" has always been racist and is irrelevant today.

Q.25 [11594329]

Directions for question (25): The passage given below is followed by four summaries. Choose the option that best captures the author's position.

As I sit in a communal garden in London at sunset and listen to more familiar, supposedly less exotic, birds, I recall Hudson's *Birds in London*. In one of its essays on sparrows, which for Hudson stood for wild nature in an urban wasteland, he wrote, "it is always possible to find something fresh to say of a bird of so versatile a mind". When I first read this, I was surprised not only by that word "fresh" but by the notion that a sparrow has a "mind". Hudson praises this humble little bird for "its greater intelligence" and "individual character". He found that, despite their ubiquity, "the individual sparrow is little known to us". Here was Hudson looking at a common bird as if for the first time.

- 1 ☐ Hudson thought that sparrows, little known creatures of greater intelligence and individual character, always provided one with something fresh to say about them.
- 2 ☐ The author recalls how Hudson, in his 'Birds in London' looks at a sparrow as if for the first time and calls it a little-known creature of greater intelligence and individual character about whom one could always say something fresh.
- 3 ☐ The author, while citing some instances from an essay in Hudson's 'Birds in London', states how Hudson could look at a common bird—sparrow—as if for the time, and admits to being surprised when he first read some of his words.
- 4 ☐ The author admires Hudson's ability to look at a sparrow as if for the first time but is surprised at his notion that sparrows have a "mind" and one can always say something "fresh" about them.

Directions for questions 26 to 28: Answer the questions on the basis of the information given below.

A dance group CRAZY CREW of college NIFF, Gujarat participated in a dance competition in an annual fest of XYZ college.

According to the rules of the competition, the group had to perform four types of dances D1, D2, D3, and D4, not necessarily in that order. Each type of dance had same number of dancers but the arrangement of these dancers on the stage during a particular dance type can be different. The arrangement of dancers on the stage for the different dance types is as follows:

D1 : All dancers should perform in an arrangement the structure of which has multiple rows facing the judges such that number of dancers in n th row (R_n) is n .

D2 : All dancers should dance in an arrangement the structure of which is a $n \times n$ grid, having same number of dancers in each row as well as in each column.

D3 : All dancers should dance in an arrangement having one or more rows with exactly 7 dancers in each row.

D4 : All dancers should dance in an arrangement having one or more rows with exactly 9 dancers in each row.

Since the number of dancers in each type of dances of the dance group has to be same, the team-lead of the group was not able to decide which dance type to perform in which order, and how many dancers to include in his group. Moreover, the judges revised the rule of performing all type of dances and asked him to perform at least 3 types of dances in any sequence.

Q.26 [11594329]

What is the minimum number of dancers required to perform at least 3 types of dances in any sequence?

Directions for questions 29 to 31: Answer the questions on the basis of the information given below.

Priyanshu recently visited Casino and played darts game for six days in a week. There were three circles on the dart board. Red the inner circle, yellow the middle circle and green the outer circle. For hitting the red circle he scored 7 points, for hitting the yellow circle he scored 2 points and if he hit the green circle, there was a penalty of 5 points. On one of the six days he tried it for less than 10 times and for the rest of days he tried it more than 10 times but not more than 18 times.

1. The number of times he hit the red circle was distinct for each day.
2. The amount he earned by scoring points is a multiple of 100 and also he had to pay the penalty points in multiple of 100s only.
3. He hit the red circle at least once on each day.

The following tables give the information about the number of times he hit the green circle on all the six days and the overall amount of money, in Rs., (earned and paid as a penalty) he had at the end of the day after he played the dart game.

Day	Green Penalty stroke
1	3
2	4
3	1
4	2
5	6
6	8

Day	Amount received/paid
1	3300
2	4600
3	7300
4	2000
5	2100
6	-2200

Q.29 [11594329]

How many total number of times he hit the red circle for all 6 days together?

1 ☐ 37

2 ☐ 35

3 ☐ 47

4 ☐ Cannot be determined

Directions for questions 32 to 35: Answer the questions on the basis of the information given below.

Six friends - A, B, C, D, E, and F - participate in an online quiz having 4 rounds. In every round, participants are awarded points and the top three participants of each round get prizes with 1st prize being a LED-TV, 2nd being a Refrigerator and 3rd being a cash prize of Rs. 10,000. All six friends participate in every round of the quiz.

Some details about who-won-what in every round is given below:

- Cash prize is won by only 3 participants and LED-TV is won by a different participant in each round.
- A wins in exactly three rounds and receives two types of prizes. C wins a Refrigerator only.
- There is only one participant who wins a prize in every round but never comes 3rd in any round.
- E wins a prize in two rounds only by coming 1st and 3rd. D wins a LED-TV only.
- D and E never win a prize in the same round. A and C win in the same round.

Q.32 [11594329]

How many prizes does F win in the online quiz?

1 ☐ 1

2 ☐ 2

3 ☐ 4

4 ☐ Either (1) or (3)

Directions for questions 39 to 41: Answer the questions on the basis of the information given below.

Four professional car racing drivers - Ned, Rob, Sophie and Cathy - participated in a Car Racing Competition at different levels - Beginner, Advanced, Intermediate and Expert (not necessarily in this order). Each of them drove a different car among SX7, i10, Hector and Omni which could further be categorised as Sedan, Hatchback, SUV and Minivan. They finished the competition at different positions - 2nd, 5th, 7th and 8th, in any order.

- (i) If i10 finished at 2nd position, then Cathy finished at 7th position. Rob participated in the Beginner level.
- (ii) If Cathy finished at 7th position, then Hector is a SUV otherwise not.
- (iii) If Ned competed in the Advanced level, then he finished at 5th position and if he competed in the Intermediate level, he finished at 7th position.
- (iv) The car that finished at 8th position was a Hatchback. This was either Hector in which case it competed in the Expert level or Omni in which case it was driven by Cathy.
- (v) If Rob's car was SX7, then SX7 was a Sedan otherwise SX7 was a SUV. Sophie's car was Hector.
- (vi) If Hector finished at 7th, then it competed in the Intermediate level otherwise it competed in the Advanced level.
- (vii) If SX7 finished at 2nd, then Cathy's car is a Hatchback otherwise Cathy's car is a SUV. Also, if Ned's car is a Minivan, then Ned finished at 7th otherwise Ned finished at 5th.

Q.39 [11594329]

Who among the following drove i10?

1 ☐ Ned

2 ☐ Rob

3 ☐ Cathy

4 ☐ Cannot be determined

- (ii) If Cathy finished at 7th position, then Hector is a SUV otherwise not.
- (iii) If Ned competed in the Advanced level, then he finished at 5th position and if he competed in the Intermediate level, he finished at 7th position.
- (iv) The car that finished at 8th position was a Hatchback. This was either Hector in which case it competed in the Expert level or Omni in which case it was driven by Cathy.
- (v) If Rob's car was SX7, then SX7 was a Sedan otherwise SX7 was a SUV. Sophie's car was Hector.
- (vi) If Hector finished at 7th, then it competed in the Intermediate level otherwise it competed in the Advanced level.
- (vii) If SX7 finished at 2nd, then Cathy's car is a Hatchback otherwise Cathy's car is a SUV. Also, if Ned's car is a Minivan, then Ned finished at 7th otherwise Ned finished at 5th.

Q.41 [11594329]

What is the position at which Cathy finished?

1 ☐ 2nd

2 ☐ 4th

3 ☐ 7th

4 ☐ 8th

Directions for questions 42 to 45: Answer the questions on the basis of the information given below.

There are 5 friends – Jon, Arya, Jaime, Tyrion, and Daenerys. Out of these five, there is only one who eats 4 scoops of icecream everyday, there are at least 2 friends who eat 2 scoops of icecream each everyday and there is at least one who don't eat icecream at all. Further, it is known that:

- (i) The friend who eats 4 scoops of icecream everyday is a Truth teller, who always speaks the truth.
- (ii) Anyone who eats two scoops of icecream is an alternator, who alternates between a truth and a lie.
- (iii) Anyone who does not eat icecream at all is a liar, who always speaks a lie.
- (iv) Anyone who eats icecream, he eats icecream of one of the 3 flavours – Black Current, Chocolate and Vanilla and no one eats icecream of more than one flavour.
- (v) Each of the 3 flavours of icecream is eaten by at least one of the 5 friends.

Further, each of the 5 friends made two statements as below:

Arya:

- (1) Everyday, I eat 2 scoops of icecream, one each of Black Current and Chocolate.
- (2) Jaime eats either 2 scoops of Vanilla or 2 scoops of Black Current everyday.

Jon:

- (1) I do not eat icecream at all.
- (2) Either Tyrion eats 4 scoops of Black Current everyday or Arya eats 4 scoops of Vanilla everyday.

Jaime:

- (1) I eat 4 scoops of Chocolate everyday.
- (2) Daenerys eats 2 scoops of Vanilla everyday.

Daenerys:

- (1) I eat 2 scoops of Chocolate everyday.
- (2) Jaime eats 2 scoops of Chocolate everyday.

Tyrion:

- (1) Jon eats 2 scoops of Vanilla everyday.
- (2) Arya does not eat icecream at all.

Q.42 [11594329]

Who among the following is the truth teller?

1 ☐ Jon

2 ☐ Jaime

3 ☐ Tyrion

4 ☐ Daenerys
