

DIRECTIONS for questions 1 to 4: The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

As the world's ranks swell, population shifts have emerged as a major global challenge with potentially catastrophic implications. Endless debates over immigration rights have failed to produce the faintest hint of an acceptable solution. So perhaps an alternative approach would be to factor in an underlying basic law of chemistry. At the risk of gross oversimplification, what if we saw the flow of populations as the human equivalent of osmosis?

In high-school chemistry we learned that, in a container of water divided into two halves by a semipermeable membrane, uneven concentrations of salt resulted in movement of water from the more dilute side to the side of greater concentration. The greater the discrepancy in solute concentration...the greater the force to equalise the concentrations.

Now imagine the world as a giant vat subdivided into a number of smaller containers (nations) separated from each other by semipermeable membranes (borders). Instead of salt, provide each container with differing amounts of food, shelter and essential services. In this scenario, population flow from nation to nation will be a direct function of the degree of difference of goods, opportunities and hope.

This shift of populations isn't just an ethical or metaphysical dilemma to be resolved at the level of 'us' versus 'them'. It isn't about the right to own land and enforce borders, or the relative worth of individuals versus groups. Instead, the pressures driving immigration should be seen as natural and unavoidable – like chemical reactions; from that perspective, a reduction in the gradients would be the only possible long-term solution.

Sadly, most policymakers focus on how to best perpetuate the imbalance. The most popular and immediate reaction is to decrease the permeability of the membranes separating countries. But beefed-up border security or the erection of theoretically insurmountable walls does not take into account the enormous power of desperation. _____

The present immigration crisis could have been predicted long ago (and, perhaps, better addressed) by acknowledging that, in addition to incendiary socioeconomic disparities, future population shifts will be fuelled by two accelerating trends: the asymmetrically greater birth rate in less affluent regions of the world, and the impending migration away from areas most affected by climate change.

...Of course, there are myriad other factors influencing the flow of populations, but without a dramatic redistribution of goods and opportunities, as well as serious attempts to control or reduce global population and an all-out effort to restrain climate change, we can expect worldwide population shifts to only increase. The stakes are high, and the necessary measures draconian and immensely unpopular with those in charge. It is easy to divert attention by arguing over the degree and maximal location of upcoming population expansion and climate change, but cherry-picking data is beside the point. When a patient has a serious illness confirmed, it is futile to keep repeating the lab tests in hopes of a different result.

Arguments for the rights of nations to control their borders are a huge step in the wrong direction. We need to take a hard look at the disruptive dynamics of inequality. If this simple fact of chemistry (that lesser flows to greater) can't penetrate the predominantly impermeable minds of policymakers, welcome to a world of escalating chaos.

Q1. Which of the following can be inferred as the author's suggestion for arriving at a probable solution for the immigration crisis?

- ☐ a) Application of the concept of osmosis to formulate the policies regarding immigration
- ☐ b) Reallocation of goods and opportunities within a country so that the less privileged populace can benefit
- ☐ c) Accept the fact that immigration is an unavoidable phenomenon and increase the permeability of the borders separating nation-states
- ☐ d) Addressing the issues of higher birth rate, in less affluent countries, and climate change

Q2. Which of the following inferences can be drawn from the line “When a patient has a serious illness... result”?

- ☐ a) Policymakers deny the existence of the immigration crisis by citing the degree and maximal locations where these problems might occur.
- ☐ b) Policymakers choose to cherry-pick information that is beneficial to their cause and divert attention from the necessary measures needed to deal with the immigration crisis.
- ☐ c) Policymakers choose to highlight the information that might show the immigration crisis in a favorable light.
- ☐ d) Policymakers look for measures that are not immensely harsh when it comes to dealing with the immigration crisis.

Q3. Which of the following lines best fills the blank at the end of the fifth para of the passage?

- ☐ a) As the British-Somali poet Warsan Shire has written: 'No one leaves home unless home is the mouth of a shark.'
- ☐ b) As the Indian-Canadian poet Rupi Kaur has written: 'You split the world into countries, declared ownership on what never belonged to you, and left the rest with nothing'
- ☐ c) As the Chinese-American poet Wang Ping has written: 'We carry old homes along the spine, new dreams in our chests...We're orphans of the wars forced upon us'
- ☐ d) As the Lebanese-Canadian poet Senait Hagose has written: 'My mind can travel anywhere, across the ocean, across dry land...past, present and future. This is my immigrant mind.'

Q4. Given below are some statements released by government agencies with respect to their strategies for dealing with the migration. Based on the passage, the author is most likely to support which of the following approaches?

- ☐ a) "Department of Homeland Security is taking action to disrupt cartels and smugglers by building the first new border wall in a decade."
- ☐ b) "The EU's newly developed strategy for containment of the migration crisis includes a unified common asylum policy, improving the lives of migrants, and better management of migrant flows."
- ☐ c) "A growing concern that our countries cannot absorb the numbers of migrants arriving at our shores is cause enough for us to close our borders to discourage migration."
- ☐ d) "A majority of Europeans believe that the influx of refugees will increase the incidence of terrorism in their countries and so, we, as EU decision-makers decided to stop irregular migration flows before they reach Europe's borders."

DIRECTIONS for questions 5 to 8: The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

Over the past quarter century, the idea of green business has expanded from a fringe group of hippie capitalists trying to increase environmental consciousness to mainstream corporations trying to establish a global standard for sustainable business. Today, for most major companies moving to greener practices is a priority.

This new landscape is encouraging but full of challenges and pitfalls. A great example is the almost blind embrace of all things “biodegradable.” The debate, about whether businesses should embrace biodegradable plastic — P.L.A., or polylactic acid — for use, say, as packaging or in utensils, is an important one.

The challenge that biodegradable plastic purportedly solves is what happens when the product becomes garbage. Many products, like a plastic coffee cup, are simply not recyclable in most global recycling systems. Therefore, an independent coffee shop has typically three choices: You can avoid the plastic cup and use another form of packaging that is recyclable or highly reusable. You can team up with a company, which offers national programs to recycle otherwise nonrecyclable waste. Or you can use biodegradable cups. The obvious benefit of biodegradable plastic is that it has the perceived ability to decompose when it becomes waste. As with many green practices, however, the devil is in the details.

For any object, it is important to look at both how it is made and how it is disposed of. With biodegradable objects, it is disposal that is the problem. Something made from biodegradable plastic will not decompose thoroughly in a landfill, because oxygen is required for such material to decompose properly and landfills have very poor oxygen flow. That means that throwing the biodegradable cup into the trash is basically as bad as throwing a normal plastic cup in the trash.

You also shouldn't throw that cup into a recycling bin because it is still not recyclable and will in fact harm the quality of the plastic made from recyclable material like soda bottles. How about composting the cup at home? Well, even if you happen to have a composting pile (as do about 5 percent of Americans), you will still be out of luck because most consumer compost piles do not get hot enough and are not maintained well enough to decompose a complex material like P.L.A.

That leaves one option: in a small number of American cities, like San Francisco, where there is municipal green waste collection, you can put the cup in such a system and it will be properly composted. Fundamentally this limits the practical use of biodegradable plastic to a handful of ZIP codes. But even then, the solution is less than satisfying. It took lots of energy to turn soil and plant into biodegradable plastic. When that plastic is composted back into soil, all of that energy is effectively wasted. The most efficient use of the energy would be to make the plastic and keep it as plastic as long as possible. Clearly, the optimal solution is to use materials that can be recycled or reused, allowing complex materials (like plastics) to remain complex materials. So why is biodegradable plastic so popular?

Simple: it's perceived to be a silver-bullet solution. You buy a product, and when you throw it away it will disappear. The truth, though, as with many green initiatives, is more complex...

Q5. The author uses the term 'devil is in the details' at the end of the third para of the passage to probably convey that

- ☐ a) it is difficult to understand how biodegradable plastic decomposes.
- ☐ b) the decomposition of biodegradable plastic is not a green practice.
- ☒ c) biodegradable plastic can be decomposed efficiently only when one pays attention to the process. **✗ Your answer is incorrect**
- ☐ d) the decomposition of biodegradable plastic once it is dumped shouldn't be a foregone conclusion.

Q6. The author's opinion about the 'silver-bullet solution' mentioned in the last para of the passage is that:

- ☐ a) green initiatives are a hoax.
- ☐ b) biodegradable plastic isn't environment friendly.
- ☒ c) **biodegradable plastic is not as simple to recycle as people imagine.** ✓ **Your answer is correct**
- ☐ d) biodegradable plastic doesn't really decompose and vanish.

Q7. All the following are facts mentioned in the passage to strengthen the argument against the use of biodegradable plastic EXCEPT

- ☐ a) decomposing biodegradable plastic in domestic compost piles is almost impractical because of the temperature requirements.
- ☐ b) biodegradable material lowers the quality of recyclable plastic made from it.
- ☒ c) **efficient biodegradable plastic collection mechanisms aren't widespread.** ✖ **Your answer is incorrect**
- ☐ d) biodegradable plastic doesn't decompose well in landfills because of the oxygen requirements of such a process.

Q8. Which of the following, if true, weakens the author's argument that 'the most efficient use of the energy would be to make the plastic and keep it as plastic as long as possible'?

- ☐ a) Plastic doesn't decompose at all when left on its own.
- ☐ b) Plastic goods cannot be used beyond a certain time period.
- ☒ c) **The manufacture of biodegradable plastic is far more energy-efficient than ordinary plastic and has a far greater shelf-life.** ✓ **Your answer is correct**
- ☐ d) Decomposition of plastic doesn't cost any energy.

DIRECTIONS for questions 9 to 12: The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

The most recent eruption of Kīlauea volcano on the island of Hawaii began in 1983. For 35 years, most of its magma emerged from a set of fissures in the volcano called the upper east rift zone. But on 3 May 2018, Kīlauea's lower east rift zone opened up, giving way to a massive outpouring of lava that devastated the south-eastern part of the island. An important question is why this change occurred in May 2018, rather than earlier or later in the course of the eruption. Writing in *Nature*, Farquharson and Amelung propose that record-breaking levels of rainfall in early 2018 increased groundwater pressures which, in turn, made it easier for rock to break and hence magma to rise to the surface at new locations.

The creation of a pathway that brings magma to Earth's surface begins with the mechanical failure of rocks. This failure can occur in two ways: new cracks can open, or existing faults can slip. Both processes can be promoted by pressure changes in groundwater. For the former, increases in fluid pressure decrease the amount of stress needed to open new cracks. For the latter, faults can slip when the stresses acting parallel to the fault (shear stresses) overcome those perpendicular to the fault (normal stresses). These normal stresses act to clamp the fault shut. Increasing fluid pressure in rocks lowers normal stresses without changing shear stresses, thus promoting fault failure.

Heavy rainfall increases water levels underground and thus pressure in groundwater. The volcanic rocks in Hawaii are very permeable, which allows water to infiltrate and pressure changes to propagate to a depth of several kilometres, close to where magma is stored. Fluid-pressure changes take time to propagate from the surface to those depths. Thus, downward migration of rock failure over time, along with a time lag between the accumulation of water at the surface and failure at depth, would be key indicators that rainfall was the cause of rock failure at Kīlauea.

Farquharson and Amelung modelled pressure changes at Kīlauea caused by rainfall in the months leading up to the eruption on 3 May 2018. Their model showed an increase in pressure of tens to hundreds of pascals at depths of several kilometres. On the basis of these changes, along with four sets of observations indicating that eruptions at Kīlauea are associated with patterns of substantial rainfall, the authors propose that heavy rainfall promoted the rock failure that enabled magma to flow into the lower east rift zone.

Is their hypothesis plausible? The pressure changes computed by their models are small — smaller than stresses from tides. However, if rocks are already close to breaking, such changes might be sufficient to initiate failure. The 2018 eruption was accompanied by a magnitude-6.9 earthquake, and examples of earthquakes caused by pressure changes on this scale are abundant...

... Although it is well established that changes in water pressure promote earthquakes, they are not necessarily a direct cause of magma eruption. To begin moving through Earth's crust, magma must create large enough stresses in the surrounding rocks to open a pathway. Earthquakes triggered in the crust around that stored magma, however, can actually relieve stress — as such, they might make it more difficult for magma to erupt... Ultimately, whether fault failure from water-pressure changes can occur close to stored magma, remains uncertain.

Q9. The theory proposed by Farquharson and Amelung is based on the understanding that ____ AND _____. Which of the options best fill the blanks in the preceding sentence?

- ☐ a) Water infiltration from the surface influences fluid pressure changes AND Rock failure propagates in the direction of fluid pressure changes.
- ☐ b) Water percolates from the surface to the depths over a long time AND it is difficult for surface pressure to dismantle the rocks underneath swiftly.
- ☐ c) **Water accumulated on the surface influences fluid pressure changes inside the rock AND Fluid pressure changes cause rock failures.**
- ☐ d) Water takes a measurable amount of time to flow down to rocks at a depth of several kilometres AND Fluid pressure propagates in the same direction as the movement of water.

Q10. Which of the following statements, if true, most weakens the arguments presented by Farquharson and Amelung?

- ☐ a) Eruptions at Kīlauea have also taken place during the dry season.
- ☐ b) The rock in the lower east rift zone was on the verge of failure even before the substantial rainfall.
- ☐ c) **The eruptions in the upper east rift zone occasionally cause earthquakes which cause rock failure in the lower east rift zone.**
- ☐ d) The pressure differential measured at depths of several kilometres varies from one rainfall to another.

Q11. Which of the following will add the most depth to the discussion in the passage?

- ☐ a) A study that establishes that water percolation leads to rock failure around magma creating a pathway for the magma.
- ☐ b) A study that surveys the impact of water-pressure changes on rock failures in the earth's crust
- ☐ c) **A study that investigates the possibility of magma generating pathways through faults in the rocks**
- ☐ d) A study that establishes a correlation between earthquakes and volcanic eruptions

You did not answer this question

Q12. The penultimate para of the passage mentions the 2018 eruption to demonstrate that

- ☐ a) volcanic eruptions can lead to earthquakes.
- ☐ b) pressure changes in the crust lead to earthquakes.
- ☐ c) **rocks close to breaking are more vulnerable to eruptions.**
- ☐ d) small changes in pressure can lead to rock failure.

DIRECTIONS *for questions 13 to 16:* The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

In a blow to gym vloggers who pretend to be scientists everywhere, the paleo diet may not be all that paleo. According to a new study, humans were eating carbs up to 170,000 years ago.

The paleo diet is based on the assumption that modern farming and agricultural practices don't match up to what the human body was made to digest. It therefore cuts out many carbohydrates: legumes, pulses, grains and even white potatoes, depending on what kind of paleo you are.

Paleo enthusiasts suggest we should return to the eating patterns of our ancestors in the Paleolithic period (spanning from about 2.5m years ago to the end of the last Ice Age, around 9600 BCE), which usually means eating mostly meat, fish, nuts and vegetables. But scientists from the Evolutionary Studies Institute (ESI) at Wits University in Johannesburg recently found evidence that southern Africans were cooking starchy plants hundreds of thousands of years ago. In case you're wondering whether a starchy plant really is a carb, the charred remnants of the plant they found is nicknamed the "African potato".

This is not the first time such evidence has arisen: previous studies have shown that our ancestors were eating starchy grains over a million years ago. There is also a body of evidence showing that humans didn't necessarily evolve to eat meat. Then again, proponents of the paleo diet call their ideology "theoretical in nature and wide for interpretation", so that information probably doesn't matter much.

"The [paleo notion] of following these very specific, restrictive guidelines really doesn't hold weight," says Meredith Price, a registered dietitian from New York. "There is no scientific proof this was the way we ate, because it wasn't." Price says that there are many benefits to eating whole grains, legumes and other things restricted by the paleo diet – such as good heart health and reduced risk of cancer and diabetes. Although there are ways to get the nutrients found in these carbohydrates elsewhere, she asks, what's the point in making it so difficult?

Of course, a movement trying to limit the refined, sugary, processed foods we are fed in abundance shouldn't be vilified – we all agree that those are bad for us. But Price emphasises that many of the benefits touted by the paleo diet seem to be about cutting out sugars and processed food rather than healthy carbs such as grains.

And while a minority of paleo enthusiasts argue that carbs are not at odds with their diet, it's hard not to think of the diet as little more than reimagined carb-phobia. Maybe the best indication of this is the beef within the paleo community over the humble potato. Paleo extremists will tell you potatoes are forbidden and argue that: "Paleo is all about eating only those foods that people living the pre-agricultural age could have eaten."

Seeing as potatoes were first domesticated between 8000 and 5000 BC, this seems like bad science – but then again, what about basing a modern diet on the proposed practices of cavemen doesn't?

Q13. Which of the following, if true, would most strengthen the author's view that the information revealed by the new study mentioned in the first paragraph is a blow to gym vloggers?

- ☐ a) Gym vloggers' only shot to fame is the information they share about paleo diet.
- ☐ b) One way in which gym vloggers make money is by spreading the word about paleo diet.
- ☒ c) **Gym vloggers maintain their bodies by following paleo diet.**
- ☐ d) Gym vloggers pretend to know everything.

Q14. The assumption made by the author in the last sentence of the third paragraph is that

- ☐ a) A plant which has 'potato' in its name has carbs in it.
- ☐ b) A plant which is called 'African potato' must be starchy.
- ☐ c) **The charred remnants of any plant which has 'potato' in its name must have carbs in it.**
- ☐ d) A plant which has 'African' in its name has carbs in it.

Q15. According to the passage, the proponents of the paleo diet

- ☐ a) do not believe that humans did not necessarily evolve to eat meat.
- ☐ b) discard any evidence that points towards paleo diet consisting of starchy grains.
- ☐ c) **are under the false impression that the diet of our ancestors was devoid of carbohydrates found in grains.**
- ☐ d) consider their ideology as “theoretical in nature” because the modern diet is different from the diet of our ancestors.

Q16. According to the author, which of the following seems like bad science?

- ☐ a) The fact that the domestication of potatoes first happened between 8000 and 5000 BC.
- ☐ b) Basing a modern diet on the healthy habits of cavemen
- ☐ c) **The forbidding of potatoes in the paleo diet**
- ☐ d) The difference in the diet of the modern and ancient humans.

Q17. DIRECTIONS *for questions 17 and 18:* The passage given below is followed by four alternate summaries. Choose the option that best captures the essence of the passage.

Theory of mind, the ability to interpret and respond to those different from us, is plainly critical to success, particularly in a globalized economy. The imperative to be empathetic is essential in any collaborative enterprise. Emotions also have an impact on the bottom line. A 1996 study published in the journal Training and Development assessing the value of training workers at a manufacturing plant in emotional management skills found that union grievance filings were reduced by two-thirds while productivity increased substantially. And a study of a Fortune 400 health insurance company conducted by Peter Salovey, a psychology professor at Yale, looked at the correlations between emotional intelligence and salary and found that people rated highest by their peers in emotional intelligence received the biggest raises and were promoted most frequently.

- ☐ a) According to the theory of mind, emotional management skills directly influence the salaries and inversely influence the grievances of employees.
- ☐ b) The importance of empathy to collaboration is beyond doubt, more so in a global economy.
- ☐ c) **There cannot be any collaboration in a corporate setup in the absence of empathy.**
- ☐ d) The ability to interpret and to respond to those different from us affects the bottom-lines in a globalised economy.

Q18. DIRECTIONS *for questions 17 and 18:* The passage given below is followed by four alternate summaries. Choose the option that best captures the essence of the passage.

A museum, it is now generally realized, deforms and disfigures the works of art it contains. It wrenches the pictures and statues out of the churches, palaces, and homes from which they drew their life and much of their significance, and exhibits them in an apparently neutral space, an intellectual void. Some of their functions have been wiped out; a good part of their meaning is lost. The walls have a colour and texture different from the ones that originally set off the works of art, so that the harmony of the paint and the marble has been denatured, the space in which the art presents itself to the spectator has been altered. Historians deplore the inevitable loss that the institution entails. Nevertheless, we cannot do without museums: if they alter the meaning of the past beyond repair, they allow some of it to survive.

- ☐ a) Museums remove pieces of art from where they belong in order to rescue them.
- ☐ b) While historians disapprove of what museums do to works of art, museums are critical in letting at least a part of the past survive.
- ☐ c) **Museums are a necessary evil, that deform the past in the process of rescuing some of it.**
- ☐ d) While museums erase the essence of some works of art, they allow others to survive.

Q19. DIRECTIONS *for question 19:* There is a sentence that is missing in the paragraph below. Look at the paragraph and decide in which blank (option 1, 2, 3, or 4) the following sentence would best fit.

Sentence: *Interestingly, though, trying to discover a person’s character and intellect based on the size and shape of their head wasn’t perceived as a serious moral issue.*

Paragraph: There is a long and tangled history to the way ‘phrenology’ has been used as a withering insult. _____(1)_____ Philosophical and scientific criticisms of the endeavour have always been intertwined, though their entanglement has changed over time. _____(2)_____ In the 19th century, phrenology’s detractors objected to the fact that phrenology attempted to pinpoint the location of different mental functions in different parts of the brain – a move that was seen as heretical, since it called into question Christian ideas about the unity of the soul. _____(3)_____ Today, by contrast, the idea of localising mental functions is fairly uncontroversial. _____(4)_____ Scientists might no longer think that destructiveness is seated above the right ear, but the notion that cognitive functions can be localised in particular brain circuits is a standard assumption in mainstream neuroscience.

- ☐ a) Option 1
- ☐ b) Option 2
- ☒ c) **Option 3**
- ☐ d) Option 4

Q20. DIRECTIONS *for questions 20 and 21:* The sentences given in the question, when properly sequenced, form a coherent paragraph. Each sentence is labelled with a number. Decide on the proper order for the four sentences and key in the sequence of four numbers as your answer, in the input box given below the question.

1. The massive, ongoing natural experiment of Wikipedia offers a unique view into such an enquiry.
2. As a result, the Internet may lead to more biased opinions, which only harden over time as users separate into rival virtual camps.
3. The Internet makes it so easy for people to aggregate; some scholars worry that people will self-select into groups with a similar ideology.
4. Does the collective will of the majority lead to democratic consensus or fundamentalist groupthink?

Q21. DIRECTIONS *for questions 20 and 21:* The sentences given in the question, when properly sequenced, form a coherent paragraph. Each sentence is labelled with a number. Decide on the proper order for the four sentences and key in the sequence of four numbers as your answer, in the input box given below the question.

1. It speaks to our feelings and imaginations, as it were by suggestion; reaching for this very reason depths of our being quite beyond the power of mere words.

2. Furthermore, instrumental music, i.e., music freed from a dependence on words, is not an exact language like prose and poetry.

3. Music consists of the intangible and elusive factors of rhythm and sound; in this way differing fundamentally from the concrete static arts such as architecture, sculpture and painting.

4. Some insight may be gained into the nature of music by a clear recognition of what it is not, and by a comparison with the more definite and familiar arts.

Q22. DIRECTIONS *for question 22:* There is a sentence that is missing in the paragraph below. Look at the paragraph and decide in which blank (option 1, 2, 3, or 4) the following sentence would best fit.

Sentence: *Rather than considering New Persian as a mixed language with Arabic elements, they built a narrative that emphasised the independence and continuity of Persian over the course of centuries.*

Paragraph: Bahar's civilisational paradigm, predicated on the notion of linguistic integrity and the association of a people with its language, came from European philology. _____(1)_____ His efforts to show Iranian continuity before and after the rise of Islam were a nationalist project, shaped by European Orientalism, especially its new philological knowledge of ancient Iranian languages. _____(2)_____ These 19th-century European philologists, and Bahar and many others who learned from their work, grouped Persian with the Indo-European family of languages distinct from Semitic languages like Arabic. _____(3)_____ In doing so, they followed a paradigm established by 19th-century Germanic linguists whose scholarship classified 'Old English' (what had been known as the Anglo-Saxon language) and 'Middle English' as precursors to modern English. _____(4)_____

- ☐ a) Option 1
- ☐ b) Option 2
- ☐ c) **Option 3**
- ☐ d) Option 4

Q23. DIRECTIONS *for question 23:* The sentences given in the question, when properly sequenced, form a coherent paragraph. Each sentence is labelled with a number. Decide on the proper order for the four sentences and key in the sequence of four numbers as your answer, in the input box given below the question.

1. Concepts pertaining to trust and expertise are also of central interest to a research area spanning psychology and computer science, as well as philosophy: namely, argumentation.
2. For example, information search systems must delineate between trustworthy and non-trustworthy sources of information.
3. Here, trust and expertise are of particular importance in the evaluation of the appeal to expert opinion, which has long been recognized as a distinct argument form.
4. The importance of trust and expertise for humans, and hence its interest for researchers in psychology, predicts its importance for artificial intelligence systems, and hence its interest for computer scientists.

Q24. DIRECTIONS *for question 24:* The passage given below is followed by four alternate summaries. Choose the option that best captures the essence of the passage.

The broadly Hobbesian thought is that, if ethics could effectively regulate behaviour in political communities as it does among friends and acquaintances, we would not require politics. We need politics in part precisely because of the ubiquity of moral disagreements about what we collectively should do, the ends to which political power should be put, and the moral principles and values that should underpin and regulate our shared political association. As such politics cannot be a domain that is straightforwardly regulated by morality.

- ☐ a) Hobbesian thought highlights that political communities cannot be regulated by ethics in the way the latter can regulate personal relationships.
- ☐ b) The influence of morality is not the same on our collective endeavours as it is on our personal associations.
- ☐ c) **Politics and morality do not go hand in hand the way personal relationships and ethics do.**
- ☐ d) Politics is necessary in order to determine the extent to which moral principles should regulate our collective behaviour.
