

DIRECTIONS for questions 1 to 4: The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

Idealism in international relations, like realism, can lay claim to a long tradition... Plato, Aristotle, and Cicero were all political idealists who believed that there were some universal moral values on which political life could be based. ... In the late fifteenth century, when Niccolò Machiavelli was born, the idea that politics, including the relations among states, should be virtuous, and that the methods of warfare should remain subordinated to ethical standards, still predominated in political literature.

Machiavelli (1469–1527) challenged this well-established moral tradition, thus positioning himself as a political innovator. The novelty of his approach lies in his critique of classical Western political thought as unrealistic, and in his separation of politics from ethics. He thereby lays the foundations for modern politics...

Machiavellianism is a radical type of political realism that is applied to both domestic and international affairs. It is a doctrine which denies the relevance of morality in politics, and claims that all means (moral and immoral) are justified to achieve certain political ends. Machiavelli never uses the phrase '*ragione di stato*' or its French equivalent, *raison d'état*, but what ultimately counts for him is precisely that: whatever is good for the state, rather than ethical scruples or norms...

Referring to Machiavelli, Heinrich von Treitschke declared that the state was power, precisely in order to assert itself as against other equally independent powers, and that the supreme moral duty of the state was to foster this power.

He considered international agreements to be binding only insofar as it was expedient for the state. The idea of an autonomous ethics of state behaviour and the concept of *realpolitik* were thus introduced. Traditional ethics was denied and power politics was associated with a "higher" type of morality. These concepts, along with the belief in the superiority of Germanic culture, served as weapons with which German statesmen, from the eighteenth century to the end of the Second World War, justified their policies of conquest and extermination.

Machiavelli is often praised for his prudential advice to leaders (which has caused him to be regarded as a founding master of modern political strategy) and for his defense of the republican form of government. There are certainly many aspects of his thought that merit such praise. Nevertheless, it is also possible to see him as the thinker who bears foremost responsibility for the demoralization of Europe. The argument of the Athenian envoys presented in Thucydides' "Melian Dialogue," that of Thrasymachus in Plato's *Republic*, or that of Carneades, to whom Cicero refers—all of these challenge the ancient views of the unity of politics and ethics.

However, before Machiavelli, this amoral or immoral mode of thinking had never prevailed in the mainstream of Western political thought. It was the force and timeliness of his justification of resorting to evil as a legitimate means of achieving political ends that persuaded so many of the thinkers and political practitioners who followed him... The tension between expediency and morality lost its validity in the sphere of politics. The concept of a double ethics, private and public, that created a further damage to traditional, customary ethics was invented. The doctrine of *raison d'état* ultimately led to the politics of *Lebensraum*, two world wars, and the Holocaust...

Q1. The author will least approve of which of the following statements about the essence of '*realpolitik*'?

- ☐ a) It incorporated *raison d'état* into national politics leading to world wars.
- ☐ b) The moral conflict that prevented policymakers from using evil for political ends was vanquished by double ethics.
- ☐ c) Politicians dispensed with traditional ethics in favour of expediency and national interests.
- ☐ d) It favoured a higher type of morality that instigated a belief in the superiority of one's own culture.

Q2. The author mentions Plato's Republic and Melian Dialogue in the penultimate para of the passage to highlight that

- ☐ a) Machiavelli wasn't the first to oppose the traditional view of the overlap between politics and ethics.
- ☐ b) Machiavelli holds responsibility for introducing amorality to politics in Europe.
- ☐ c) Machiavelli's break from conventional views of politics and ethics prevailed because it was the need of the hour.
- ☐ d) it wasn't Machiavelli who actually first justified evil as a legitimate political tool.

Q3. Which of the following is a statement Machiavelli cannot use to debate against idealists such as Plato and Aristotle, as understood from the passage?

- ☐ a) If ethics could effectively regulate behaviour in political communities as it does among, say, friends and acquaintances, we would not require politics.
- ☐ b) Ethical values have a foundational role in determining the appropriate ends and limits of politics as they have antecedent authority over political values.
- ☐ c) Morality cannot purport to guide political behaviour in the same way in which it guides personal conduct.
- ☐ d) It is doubtful whether ethics provides a suitable blueprint for action in a sphere that is constituted by disagreement, contestation, and coercion.

Q4. Which of the following is not an example of a 'higher type of morality' as understood from the passage?

- ☐ a) Country A, which has a bilateral trade agreement with Country B, enters into a new one with Country C, which is a stark rival of Country B.
- ☐ b) Country X goes to war against Country Y, since it brings Country X greater access to natural resources it needs for world dominance.
- ☐ c) Country A doesn't defend Country B against a powerful opponent, Country C, despite Country A providing past assurances of support to Country B.
- ☐ d) Country P uses technological surveillance to curtail the freedom of citizens under the pretext of national security.

... “Art-langs”, new languages to give depth and verisimilitude to imaginary worlds in works of fiction, change and shift according to linguistic ideas at different times, and can tell us a lot about popular perceptions of our own, natural languages. Some of the earliest examples of fictional languages can be found in early modern “traveller’s tales”, which combined interest in real-world exploration with fantastical lands. Speakers of imaginary languages populate Thomas More’s Utopia (1516) and the numerous islands of Gulliver’s Travels (1726) ... As the unexplored parts of our planet became scarce, writers moved imaginary lands to the moon, to other planets, or underground... This tradition continued with Victorian “art-langs”: in Edward Bulwer-Lytton’s The Coming Race (1871), the speakers of Vril-ya inhabit a subterranean world. Vril-ya is a clear example of a fictional language engaging with contemporary linguistics: it has resonances with Indo-European languages and supposedly underwent various phases of development, corresponding to the theories of the nineteenth-century Oxford philologist Max Müller.

And then came Tolkien, who moved the goalposts considerably and established invented languages as a hallmark of modern fantasy worlds. Tolkien was a philologist himself. He was also an expert on Old and Middle English, and on Old Norse (with a working knowledge of many other languages) ... Following the Indo-European model of a “tree of languages”, all originating from the same proto-language, and branching off to form language families and then individual languages, Tolkien started by inventing base-roots and modifying them to show how his fictional languages developed over time.

A different tradition of linguistic invention in the twentieth century finds form in dystopian fiction, which explores language’s ability to manipulate us. George Orwell’s Nineteen Eighty-Four (1949) doesn’t contain many examples of Newspeak in use, but it explores the possibility of a language with a limited vocabulary (850 words) to restrict thought. Newspeak is a drastically pared-down English, accompanied by new compounds. Invented terms such as doublethink (holding two contrasting views at the same time without perceiving the paradox) and thoughtcrime (thinking ideas proscribed by the Party) have entered popular usage to describe the behaviour of totalitarian regimes. Orwell’s fictional language seems to be responding to the Sapir-Whorf hypothesis, which argues that language determines (or at least influences) our thought and world view.

In a similar vein, Anthony Burgess uses English as a basis, but adds invented words mostly based on Russian, combined with elements of Elizabethan syntax, to create Nadsat, the language used by the narrator of A Clockwork Orange (1962). Alex and his droogs (an Anglicization of the Russian drug, “friend”) revel in actions of extreme violence. Their counterculture is epitomized by their use of Nadsat (“teen” in Russian), which is – strictly speaking – a slang or argot, rather than a language. Burgess [...] wanted his young protagonists to speak their own teenage slang that would not become dated with time; it has aged well. Nadsat continues to create an estrangement effect on the reader, distorting her relationship with the violence that is described.

... Art-langs over the centuries have taken readers to fictional places, or even entire worlds; they are both a mirror of cultural ideas and a vehicle for artistic expression. They are an unfamiliar way to examine the most familiar element of our culture.

Q5. When the author points out that Tolkien ‘moved the goalposts considerably’, it is implied that

- ☐ a) no one had invented languages in fantasy fiction prior to Tolkien.
- ☐ b) no creator of modern fantasy worlds had extensively charted the evolution of fictional languages.
- ☐ c) Tolkien transformed the creation of fictional languages for fantasy worlds into a more acceptable practice.
- ☒ d) Tolkien entrenched the usage of fictional languages more firmly into the fantasy worlds of his creation. ✔ Your answer is correct

Q6. Based on what can be inferred from the passage, which of the following most strengthens the Sapir-Whorf hypothesis?

- ☐ a) An alien planet sends signals to the earth sharing their language because of which we learn to think like the aliens do.
- ☒ b) **It has been commonly observed that the languages of people belonging to the nicest cultures on the planet have few pejorative words.** ✖ **Your answer is incorrect**
- ☐ c) The most optimistic cultures around the world speak languages which have more positive than negative words.
- ☐ d) **Many languages, like Japanese, have words to directly point to complicated emotions that those who speak the language often feel.**

Q7. The author uses the example of Nadsat to propound the theory that

- ☐ a) fictional languages can create an estrangement effect on the reader.
- ☐ b) language has an influence on how we perceive things.
- ☒ c) some invented languages have stood the test of time to stay relevant. **✗ Your answer is incorrect**
- ☐ d) invented words distort a reader's perception of violence in fictional tales.

Q8. All the following can be inferred to be characteristics of 'art-langs' EXCEPT:

- ☐ a) they can originate from a proto-language and then branch off to form their own families.
- ☐ **b) they are created to demonstrate the ability of language to manipulate us.**
- ☐ c) they are invented in order to lend authenticity to fictional fantastical worlds.
- ☐ d) they may follow similar rules to those existing in contemporary linguistics.

DIRECTIONS for questions 9 to 12: The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

Economic theory provides a powerful but incomplete guide to the empirical determinants of health care demand. Health economists generally assume that the demand for health care derives from a demand for health. We consume health services as either an investment in our future health, to cope with chronic illness, or recover from acute illnesses or accidents. Rarely medical care is availed simply because it is enjoyed, but we seek it for our health. Health then, along with price (or its proxy health insurance), income, and consumer preferences, play the main role in formal economic models of consumer decision-making about health care.

Yet, this theory takes us only so far. Although central to demand, economic theory is agnostic as to how individuals form preferences. It is suspected that individuals vary in attitudes and preferences toward risk, willingness to trade-off better health tomorrow for increased consumption today, and likes and dislikes. As a result, people with the exact same economic resources may respond differently to the same medical circumstances. However, these individual preferences are almost never directly observed – they are difficult to measure outside of controlled experiments. Health care prices and income too are almost never observed in the way we would like.

However, empirical studies consistently demonstrate that a wide range of sociodemographic characteristics including age, ethnicity, sex, and education are strongly correlated with health care use. These rarely appear directly in the theoretical models. Sociodemographic characteristics are intended to be included in empirical models because it is believed that they are correlated with otherwise unmeasured preferences toward health or capture dimensions of a person's health (e.g., age), or both. However, interpretation is difficult because these proxy measures are often confounded with so many different unobserved aspects of individuals and their environment.

Economic theory also posits that health care demand is jointly determined with supply. In practice, empirical models of consumer demand are almost never jointly estimated with models of supply because of data limitations. Instead, these empirical models assume that observed health care use is equal to consumer demand (technically, short-run supply is assumed to be perfectly elastic at the margin). Researchers sometimes add measures of provider supply and other market characteristics on an ad hoc basis to individual characteristics in empirical models of demand. However, interpretation here is problematic. For example, physicians tend to locate in areas with high demand. Thus, a measure of supply, like physicians per capita, will tend to reflect back demand rather than being a causal determinant of demand.

How then do we decide which determinants to include in our empirical models of health care demand? And how do we interpret them? Although, theory is by no means definitive, economic principles can still be appealed to understanding the relationships among the theoretical and proxy determinants. Statistical principles also play a role. Overall, competing concerns about usefulness of particular variables as predictors of health care use and the potential biases they introduce must be confronted.

Q9. Which of the following statements, if true, most weakens the assumption health economists make with respect to health care demand, mentioned in the first para of the passage?

- ☐ a) Consumers choose to avail health insurance which covers long-term, severe illnesses as opposed to that which covers small ailments.
- ☒ b) **The typical consumer considers health insurance mostly as a financial investment, in order to avail benefits such as tax exemption on income.** ✓ Your answer is correct
- ☐ c) **The income of a consumer directly determines their preference of the various health insurance plans available in the market.**
- ☐ d) **The extent of investment in a health care plan is solely dependent on the price of the plan and the earning capacity of the consumer.**

Q10. Which of the following correctly captures the difference between empirical and theoretical models in the health care domain?

- ☐ a) The latter considers supply and demand to be mutually exclusive; however, empirical models work under the assumption that demand is mostly estimated in correlation with supply.
- ☐ b) **Empirical models of health care demand shed light on the verifiable determinants, both direct and proxy, whereas theoretical models, while powerful, are still an incomplete guide to the same.**
- ☒ c) **While empirical models regularly include sociodemographic characteristics as proxy measures to determine consumer preferences, theoretical models seldom include said characteristics.** ✓ **Your answer is correct**
- ☐ d) **Theoretical models are sceptical towards considering how consumers form preferences, even though this is a central aspect in determining demand; empirical models address this drawback.**

Q11. While determining health care demand, economic theory is least likely to make which of the following assumptions?

- ☐ a) The price of a health care service depends on the provider of the service.
- ☒ b) **The demand for a health care service is dependent on the supply. ✖ Your answer is incorrect**
- ☐ c) **People's individual preference for a health care plan varies based on ailments they think they are likely to suffer from.**
- ☐ d) **People's income and health care prices play a part in the demand for health care.**

Q12. The author of the passage is likely to recommend all of the following steps to further economic theory in the healthcare domain EXCEPT:

- ☐ a) Application of behavioural economics concepts to understand and measure consumer preferences
- ☐ b) **Usage of statistical techniques and tools to understand the impact of healthcare prices and consumer income on demand**
- ☐ c) **Exploration of theoretical and proxy variables and the likely biases they introduce, in order to predict health care demand and use**
- ☐ d) **Calculation of demand for health in combination with consumer preferences, income and healthcare price.**

DIRECTIONS for questions 13 to 16: The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

... Because insects are legion, inconspicuous and hard to meaningfully track, the fear that there might be far fewer than before was more felt than documented, a feeling so common entomologists developed a shorthand for it - the windshield phenomenon... Humans are not great at remembering the past accurately. This is especially true when it comes to changes to the natural world... In decades of photos of fishermen holding up their catch in the Florida Keys, the marine biologist Loren McClenachan found a perfect illustration of this phenomenon, which is often called "shifting baseline syndrome." The fish got smaller and smaller, to the point where the prize catches were dwarfed by fish that in years past were piled up and ignored. But the smiles on the fishermen's faces stayed the same size...

What we're losing is not just the diversity part of biodiversity, but the bio part: life in sheer quantity. For example, the world's largest king penguin colony shrank by 88 percent in 35 years, more than 97 percent of the bluefin tuna that once lived in the ocean are gone... Finding reassurance in the survival of a few symbolic standard-bearers ignores the value of abundance... Tigers still exist, for example, but 93 percent of the land where they used to live is now tigerless. Large animals, especially top predators like tigers, connect ecosystems to one another and move energy and resources among them simply by walking and eating and defecating and dying. In the deep ocean, sunken whale carcasses form the basis of entire ecosystems in nutrient-poor places. One result of their loss is what's known as trophic cascade, the unravelling of an ecosystem's fabric as prey populations boom and crash and the various levels of the food web no longer keep each other in check...

Scientists speak of functional extinction, when animals and plants are present, but no longer prevalent enough to affect how an ecosystem works - the extinction not of a species but of all its former interactions with its environment, an extinction of seed dispersal and predation and pollination and all the other ecological functions an animal once had. The more interactions are lost, the more disordered the ecosystem becomes. A paper in *Nature* suggested that a loss of even 30 percent of a species' abundance can be so destabilizing that other species start going fully, numerically extinct. A famous real-world example of this type of cascade concerns sea otters. When they were nearly wiped out in the northern Pacific, their prey, sea urchins, ballooned in number and [completely] decimated kelp forests, turning a rich environment into a barren one and also possibly contributing to numerical extinctions, notably of the Steller's sea cow.

... In addition to extinction (the complete loss of a species) and extirpation (a localized extinction), scientists now speak of defaunation: the loss of individuals, the loss of abundance, the loss of a place's absolute animalness. It is estimated that, since 1970, Earth's various populations of wild land animals have lost, on average, 60 percent of their members... If you look at the world's mammals by weight, 96 percent of that biomass is humans and livestock. We talk about living in the Anthropocene, a world shaped by humans. But E.O. Wilson, the naturalist and prophet of environmental degradation, has suggested another name: the Eremocene, the age of loneliness.

Q13. The author's purpose in describing the unchanged smiles on the 'fishermen's faces' in the first para is to show

- ☐ a) that the windshield phenomenon applies not just to insects but to other living beings as well.
- ☐ b) the pride of human beings in believing that they are better than their predecessors.
- ☐ c) the causal effect of human forgetfulness on the degradation of the planet.
- ☐ d) the inability of humans to register the gradual decadence of the environment.

Q14. Which of the following fictional scenarios best fits the way 'shifting baseline syndrome' has been depicted in the passage?

- ☐ a) The local fishermen celebrate the increase in the fish stock in a nearby lake compared to the previous two years, even though it is half of what it used to be ten years ago.
- ☐ **b) When residents younger than 25 years of age, of a rural area Y, were asked to guess the commonest bird in their region 50 years ago, 80% of them named the bird most commonly found in the area at the time of the survey.**
- ☐ c) **Country X** has been internationally appreciated for increasing its forest cover to 5% more than the continental average.
- ☐ d) **A country J** has made commercial whaling legal, after years of embargo, claiming that the whale population in seas under its jurisdiction has grown enough not to be categorised as 'endangered'.

Q15. Using the case of tigers, the author builds the argument that

- ☐ a) activists need to focus on abundance of important species rather than their mere survival.
- ☐ **b) large predators are impactful when they are present in big numbers, and not simply surviving.**
- ☐ c) there is nothing reassuring about the survival of tigers because their low numbers make them functionally extinct.
- ☐ d) the celebration of survival of tigers takes the focus away from their loss of habitat.

Q16. Which of the following cannot be inferred from the second para of the passage?

- ☐ a) Top predators like tigers are part of multiple ecosystems.
- ☐ b) **Nutrients are important for ecosystems to thrive.**
- ☐ c) **Drastic changes in prey populations can have an adverse effect on the entire ecosystem.**
- ☐ d) **A whale can be an entire ecosystem on its own.**

Q17. DIRECTIONS *for question 17:* The sentences given in the question, when properly sequenced, form a coherent paragraph. Each sentence is labelled with a number. Decide on the proper order for the four sentences and key in the sequence of four numbers as your answer, in the input box given below the question.

1. The meaning of equity, in its literal sense, further expands to fairness, impartiality and even-handed dealing.
2. The scope of equity extends to filling the lacunae that exist in law, in light of good conscience.
3. Judicial systems across the globe, ranging from the United Kingdom to India, have incorporated the principles of equity in their legal systems.
4. Aristotle defined equity as correction of law where it is defective on account of its generality.

Q18. DIRECTIONS *for question 18:* There is a sentence that is missing in the paragraph below. Look at the paragraph and decide in which blank (option 1, 2, 3, or 4) the following bold sentence would best fit.

Sentence: *As a rule, the pact with the devil as it appears in trial records was not a contract like that of Goethe's Faust, which was mostly about the wishes of the magician.*

Paragraph: At first glance, the relation between the economy and the imaginary magic of the witches seems to be entirely negative. ____ (1) ____ Witches were often accused of attacking livestock. They magically made frost, storm and hail, and thereby caused crop failure. Indeed, their weather magic was said to endanger the economy of entire regions. Still, at least in the majority of the witch trials on the European continent, the witches didn't profit from their magic. ____ (2) ____ Weather magic especially looked like a strange form of auto-aggression because the hailstorms the witches supposedly conjured up damaged their own fields as well. ____ (3) ____ Rather, it stated simply that the witch submitted to the will of the demon. She did what a demon told her and became the instrument of the demon's abyssal hatred of all creation. ____ (4) ____ Witchcraft was mostly about destruction for destruction's sake, not about the personal interests and wishes of the witches, let alone their economic advantage.

- ☐ a) Option 1
- ☐ b) Option 2
- ☒ c) Option 3 ✓ Your answer is correct
- ☐ d) Option 4

Q19. DIRECTIONS *for question 19:* The passage given below is followed by four alternate summaries. Choose the option that best captures the essence of the passage.

Narrative as it is used by historians is not merely an incidental, stylistic feature of the historian's craft, but essential to historical explanation. Narrative presupposes a world of things that endure through change. Stories fill in the gaps in our experience and thus make continuity visible. Ideally, narrative stands proxy for experience, though this ideal can never be attained. No criterion can be formulated that will signify when a story is complete enough. The changing perspective of the historians and the infinite detail with which they have to deal make their task a continuous one. Yet, the historians cannot be radically subjective because their story is always limited by the chronology of the events and the accuracy of the details.

- ☐ a) Historians use narrative to fill the gaps in stories that need continuity as history is constrained by chronology and accuracy of details.
- ☐ b) **Constrained by chronology and details, historians use narrative to bring continuity to the experience that historical explanations cannot provide on their own.**
- ☐ c) **Narrative is an imperfect proxy for experience, but it is persisted with to reflect the continuity of a story and a historian's perspective, through limitations of chronology and accuracy.**
- ☒ d) **Narrative is essential to bring to historical stories what they lack in experience because of the limitations placed by chronology and accuracy of details.** **✗ Your answer is incorrect**

Q20. DIRECTIONS *for question 20:* The sentences given in the question, when properly sequenced, form a coherent paragraph. Each sentence is labelled with a number. Decide on the proper order for the four sentences and key in the sequence of four numbers as your answer, in the input box given below the question.

1. Indeed, Anarchism alone makes non-authoritarian organization of common interests possible, since it abolishes the existing antagonism between individuals and classes.
2. Analogously, the organized activity of free human beings, imbued with the spirit of solidarity, results in the perfection of social harmony – which is Anarchism.
3. Under present conditions the antagonism of economic and social interests results in relentless war among the social units, and creates an insurmountable obstacle in the way of a co-operative commonwealth.
4. It is the harmony of organic growth which produces variety of colour and form -- the complete whole we admire in the flower.

Q21. DIRECTIONS *for question 21:* The passage given below is followed by four alternate summaries. Choose the option that best captures the essence of the passage.

The leitmotiv of those who despise filmed theatre, their final and apparently insuperable argument, continues to be the unparalleled pleasure that accompanies the presence of the actor. “What is specific to theater,” writes Henri Gouhier, in *The Essence of Theater*, “is the impossibility of separating the action and actor.” Elsewhere he says “the stage welcomes every illusion except that of presence; the actor is there in disguise, with the soul and voice of another, but he is nevertheless there and by the same token space calls out for him and for the solidity of his presence. On the other hand, and inversely, the cinema accommodates every form of reality save one—the physical presence of the actor.” If it is here that the essence of theater lies, then undoubtedly the cinema can in no way pretend to any parallel with it.

- ☐ a) Cinema cannot equal theatre without offering the presence of an actor as the latter does.
- ☐ b) **The only reality cinema doesn't accommodate is the presence of an actor, which is the only part of theatre that isn't an illusion.**
- ☐ c) **Critics of cinema, despite cinema's great resemblance to reality, seek pleasure in the actor's physical presence, which makes theatre more pleasurable to them.**
- ☐ d) **While cinema mimics reality more closely, the presence of an actor, draws many to theatre, despite its more elusive nature.**

Q22. DIRECTIONS *for question 22:* The sentences given in the question, when properly sequenced, form a coherent paragraph. Each sentence is labelled with a number. Decide on the proper order for the four sentences and key in the sequence of four numbers as your answer, in the input box given below the question.

- 1. You cannot read The Plague except as a thinly disguised allegory of human nature.
- 2. The historian Tony Judt once said that Albert Camus’s novel The Plague was about the plague in the same sense that King Lear is about a king named Lear.
- 3. The genome is also a testing ground for our fallibilities and desires, although reading it does not require understanding allegories or metaphors.
- 4. In The Plague, a biological cataclysm becomes the testing ground for our fallibilities, desires, and ambitions.

Q23. DIRECTIONS *for question 23:* The passage given below is followed by four alternate summaries. Choose the option that best captures the essence of the passage.

Visualizations can reveal patterns, trends and connections in data that are difficult or impossible to find any other way. And yet few scientists take the same amount of care with visuals as they do with generating data or writing about it. The graphs and diagrams that accompany most scientific publications tend to be the last things researchers do. As a result, science is littered with poor data visualizations that confound readers and can even mislead the scientists who make them. Deficient data visuals can reduce the quality and impede the progress of scientific research. And with more and more scientific images making their way into the news and onto social media — illustrating everything from climate change to disease outbreaks — the potential is high for bad visuals to impair public understanding of science.

- ☒ a) **By not paying enough attention to visualisations, scientists risk impeding the layman's understanding of science through misleading information.** ✓ **Your answer is correct**
- ☐ b) **Visualisations should be used by scientists to give the public a better understanding of science.**
- ☐ c) **The understanding of science has suffered badly because of scientists not paying the same attention to visualisations as they do to graphs and diagrams.**
- ☐ d) **Only a few scientists give visuals the attention they deserve because of the role they play in making science more comprehensible.**

Q24. DIRECTIONS *for question 24:* There is a sentence that is missing in the paragraph below. Look at the paragraph and decide in which blank (option 1, 2, 3, or 4) the following sentence would best fit.

Sentence: *Rather than an act of reasoning, philosophy is an activity: it is a relationship towards the world.*

Paragraph: Jaspers’s distancing from a more popular idea of existentialism has much to do with the aims and ends of his philosophy of existence. In the three-volume *Philosophie*, the aim is to explore how to exist in the world philosophically. ____ (1) ____ The three volumes of *Philosophie* can be seen as instruction manuals. ____ (2) ____ They start from the position of the self, which finds itself immediately within a world, and from there one has to find out *how* to exist, rather than *what* existence is. ____ (3) ____ The three volumes of his *Philosophie* each deal with different aspects of human existence and engagement in the world: orientation, existence, and metaphysical transcendence, as well as forms of knowledge associated with those aspects (objective knowledge, subjective self-reflection, and symbolic interpretation of the metaphysical). ____ (4) ____ These stages of existence are continuously bound together with one another – we find ourselves in the world, we question ourselves and find we cannot ground or justify ourselves, and we look beyond ourselves to find the truth of existence.

- ☐ a) Option 1
- ☒ b) Option 2 ✖ Your answer is incorrect
- ☐ c) Option 3
- ☐ d) Option 4
