

DIRECTIONS for questions 1 to 4: The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

"In making predictions and judgments under uncertainty, people do not appear to follow the calculus of chance or the statistical theory of prediction," Daniel Kahneman, of the Hebrew University of Jerusalem, and his colleague Amos Tversky wrote in 1973. "They rely on a limited number of heuristics which sometimes yield reasonable judgments and sometimes lead to severe and systematic errors." Heuristics are rules of thumb—decision-making shortcuts. Kahneman and Tversky didn't think relying on them was always a bad idea, but they focused their work on heuristics that led people astray. Over the years they and their adherents assembled a long list of these decision-making flaws—the availability heuristic, the endowment effect, and so on. Kahneman won an economics Nobel in 2002—Tversky had died in 1996 and thus couldn't share the prize—and the heuristics-and-biases insights relating to money became known as behavioural economics.

The implications for how to make better decisions, though, are less clear. First-generation decision analysts such as Howard Raiffa and Ward Edwards recognized the flaws described by Kahneman and Tversky as real but thought the focus on them was misplaced and led to a fatalistic view of man as a "cognitive cripple." Even some heuristics-and-biases researchers agreed. And so, a new set of decision scholars began to examine whether those shortcuts our brains take are actually all that irrational.

That notion wasn't entirely new. Herbert Simon had begun using the term "heuristic" in a positive sense in the 1950s. Decision makers seldom had the time or mental processing power to follow the optimization process outlined by the decision analysts, he argued, so they "satisfied" by taking shortcuts and going with the first satisfactory course of action rather than continuing to search for the best.

Simon's "bounded rationality" is often depicted as a precursor to the work of Kahneman and Tversky, but it was different in intent. Whereas they showed how people departed from the rational model for making decisions, Simon disputed that the "rational" model was actually best. In the 1980s others began to join in the argument. The most argumentative among them was Gerd Gigerenzer, a German psychology professor who also did doctoral studies in statistics. He was, first, dubious of some of the results. By tweaking the framing of a question, it is sometimes possible to make apparent cognitive illusions go away. Gigerenzer and several coauthors found, for example, that doctors and patients are far more likely to assess disease risks correctly when statistics are presented as natural frequencies (10 out of every 1,000) rather than as percentages...

Gigerenzer is not alone, though, in arguing that we shouldn't be too quick to dismiss the heuristics, gut feelings, snap judgments, and other methods humans use to make decisions as necessarily inferior to the probability-based verdicts of the decision analysts. Even Kahneman shares this belief to some extent... One of the stars of Malcolm Gladwell's book Blink, Klein studies how people – firefighters, soldiers, pilots – develop expertise, and he generally sees the process as being a lot more naturalistic and impressionistic than the models of the decision analysts. He and Kahneman have together studied when going with the gut works and concluded that, in Klein's words, "reliable intuitions need predictable situations with opportunities for learning."

Q1. The argument that heuristics affect our decision-making process negatively can be invalidated if it can be proven that:

- ☐ a) The optimization process outlined by decision analysts isn't any more efficient compared to bounded rationality.
- ☐ b) Decision makers do not always have the luxury of time to follow the optimisation process outlined by decision analysts.
- ☒ c) **Decisions are often influenced by several biases most of which can be identified and eliminated from our thought process.** ✖ Your answer is incorrect
- ☐ d) Heuristics-based decisions help an individual in avoiding overanalysing every situation.

Q2. The example of doctors and patients assessing disease risks correctly when statistics are presented as natural frequencies weakens which of the following arguments?

- ☐ a) Cognitive illusions of participants of a study are a function of how the questions are framed to them.
- ☒ b) **It is not possible to circumvent the influence of cognitive biases of decision makers while making decisions.** ✓ **Your answer is correct**
- ☐ c) **Decision makers go with the first satisfactory course of action instead of following an optimisation process.**
- ☐ d) Heuristics and other methods humans use to make decisions are inferior to probability-based verdicts.

Q3. Which of the following best represents the contrast between the work of Herbert Simon and that of Kahneman and Tversky?

- ☐ a) The former showed that people didn't depart from the rational model to take decisions while the latter showed otherwise.
- ☐ b) **The former showed that not all rational models provide the best course of action whereas the latter showed that rational models are not followed by individuals.**
- ☒ c) **The former showed that a rational model may not be the best, whereas the latter showed that the use of heuristics goes against the rational model.** ✓ **Your answer is correct**
- ☐ d) The former showed that rational models work well for people when mixed with heuristics while the latter showed that rational models don't work well with heuristics.

Q4. Which of the following, if true, doesn't weaken the 'fatalistic view of man as a cognitive cripple' as understood from the second para of the passage?

- ☐ a) Our gut feeling is fairly reliable when it comes to dangerous places or people.
- ☐ b) **Heuristics and biases are based on repetitive past experiences.**
- ☐ c) **Sportspeople usually take good instinctive decisions even under high pressure.**
- ☒ d) **Shortcut decisions compensate for the lack of a little efficiency by saving time and resources.** ✖ **Your answer is incorrect**

DIRECTIONS for questions 5 to 8: The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

The human eye is a sophisticated instrument: images enter through a curved lens at the front of the sphere and pass through its gooey, vitreous liquid before reaching the light-sensitive retina – which relays the signal to the optic nerve that carries the picture to the brain. Engineers have attempted to replicate this structure for about a decade. Now a new artificial eye successfully mimics the natural instrument's spherical shape. Researchers hope this achievement could lead to sharper robotic vision and prosthetic devices. A paper on the development was published on Wednesday in Nature.

The research built on the fact that perovskite, a conductive and light-sensitive material used in solar cells, can be used to create extremely thin nanowires several thousandths of a millimeter in length. These wires mimic the structure of the eye's long, thin photoreceptor cells, says study co-author Zhiyong Fan, an electronic and computer engineer at the Hong Kong University of Science and Technology. "But the difficulty is: How can we fabricate an array of the nanowires in a hemispherical substrate to form this hemispherical retina?" he adds. Constructing a curved retina is important because light only hits it after passing through a curved lens. "When you try to image something, the image that forms after the lens is actually curved," says Hongrui Jiang, an electrical engineer at the University of Wisconsin–Madison, who reviewed the new paper but was not directly involved in the work. "If you have a flat sensor, then the image cannot be focused very sharply." The retina is curved, but electronic light sensors are rigid and flat.

To solve the problem, Fan and his colleagues deformed soft aluminium foil into a hemispherical shape. Then they treated the metal with an electrochemical process that converted it into an insulator called aluminium oxide. This process also left the material studded with nanoscale pores. As a result, the researchers were left with a curved hemisphere that had convenient densely clustered holes in which they could "grow" perovskite nanowires...

Once they had their curved "retina," the scientists incorporated it into an artificial eye that included a curved lens at the front. Inspired by the specialized liquid in a real eye, the team filled its biomimetic version with an ionic liquid, a type of liquid salt in which charged particles can move. "One very important component inside is in the cavity we filled [with] ionic liquids," Fan says. "Once these nanowires generate charges, the charge will be exchanged with some ions." This electrical exchange allows the perovskite nanowires to perform the electrochemical function of detecting light and sending that signal to external image-processing electronics.

When the team tested the artificial eye, it managed to process patterns of light in as little as 19 milliseconds – half the time required by a human eye. And it produced images that had a greater contrast and clearer edges than those generated by a flat image sensor with a similar number of pixels. In some ways, the artificial eye improved on natural vision: it could pick up a greater range of wavelengths and lacked a blind spot. Fan hopes to work with medical researchers to build prosthetic devices based on his team's design...

Q5. Which of the following is true about the fabrication of the biomimetic version of the eye?

- ☐ a) It uses a hemispherical foil coated with aluminium oxide to function like a curved retina.
- ☒ b) **Perovskite nanowires act as photoreceptor cells generating charge from light signals.** ✓ Your answer is correct
- ☐ c) **Perovskite nanowires can produce charges only when immersed in a liquid salt.**
- ☐ d) **Nanoscale pores in aluminium foil assist in the generation of perovskite nanowires.**

Q6. The function of the ionic liquids in the biomimetic version of the eye is to:

- ☐ a) Create the charges needed for perovskite nanowires to perform the electrochemical function of detecting light
- ☐ b) **Generate signals in external image-processing electronics based on electrical exchanges inside perovskite nanowires**
- ☐ c) **Fill the cavity where the perovskite nanowires can be grown to perform their photoreceptor function**
- ☒ d) **Transfer the electric charge generated by perovskite nanowires to image-processing electronics.** ✓ **Your answer is correct**

Q7. Which of the following cannot be inferred from the last para of the passage?

- ☐ a) The natural eye has blind spots in its field of vision.
- ☒ b) **The natural eye image has lower contrast and less clear edges than that of the artificial eye.** ✓ **Your answer is correct**
- ☐ c) **The natural eye cannot process the range of wavelengths that the artificial eye processes.**
- ☐ d) **The human eye is slower than the prosthetic eye in processing patterns of light.**

Q8. The problem created by rigid and flat electronic light sensors while mimicking the functioning of the natural eye is that:

- ☒ a) **They do not replicate the functioning of the retina which is curved.** ✓ **Your answer is correct**
- ☐ b) **They cannot be used to grow perovskite nanowires.**
- ☐ c) **The image formed after passing through the lens is curved.**
- ☐ d) **They need to be hemispherical to fabricate nanowires.**

DIRECTIONS *for questions 9 to 12:* The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

The relationship between sleep, dreaming, and creativity has been the subject of conjecture for hundreds of years. The American inventor Thomas Edison had designed a strategy for mining his dreams for material. He would doze off with a steel sphere in each hand. Once his body went limp with sleep, the spheres would drop to the floor with a clatter and wake him up. He could then recall details of his dreams and record any insights...

Scientific studies seem to validate these tales. Study participants asked to “incubate” a problem in their dreams often come up with a useful solution, and both the frequency and complexity of one’s dream recall have been correlated with higher scores on creativity evaluations. The stage of sleep most closely associated with creative inspiration is known as REM, short for rapid eye movement. REM sleep begins about 70 minutes after a person loses consciousness and is rich with dream life. Lucid dreams, in which the dreamer knows he or she is dreaming and can sometimes direct the dream, are thought to primarily occur in REM...

But researchers have recently identified another state of mind that lies in the transition between waking and sleeping and may be even more fertile for creative inspiration than REM. It is called N1 or sleep onset, and it is the first of three stages in pre-REM sleep. N1 is a hybrid, or “semilucid” state of mind, says French neuroscientist Celia Lacaux, when individuals are just beginning to detach from the waking environment. This shadowy frontier between waking and dreaming, to which all sleepers have access, may be the source of many of humanity’s most novel ideas, inventions, and works of art. Psychologists call it “hypnagogia,” after the Greek words for “sleep” (hypnos) and “to lead” (agogo). Inspired by Thomas Edison, Lacaux had study subjects nap with a plastic bottle that dropped when they fell asleep, waking them. They were then tested to see if they could solve a math problem with a hidden rule. She found that those who woke from the earliest stage of sleep were far more likely to solve the problem.

Like REM sleep, N1 often features involuntary dream-like perceptual phenomena. These are known as hypnagogic hallucinations, and they combine details from recent waking experiences with loosely associated memories in novel or unusual ways. The difference is that in N1, the dreamer is closer to the surface of sleep, to conscious control and to the external perceptual environment.

A relationship between hypnagogia and creativity makes intuitive sense. One major theory of creativity posits that it results when our minds make connections between distantly related concepts stored in our memories. This is a process that is thought to occur naturally during sleeping and dreaming: New memories mingle in novel and abstract ways with older ones as a means of consolidating them, laying down tracks in our brains for later recollection. Neuroscientist Karl Friston, who studies consciousness, proposes that this mashing together of old and new is a process that helps to minimize redundancy and complexity in our memory system, and prepares us to navigate a fuller range of possible scenarios in our waking lives...

Q9. The purpose of the first para is to establish the idea that:

- ☐ a) **The relationship between sleep, dreaming and creativity has been studied for hundreds of years.**
- ☒ b) **The conjecture that dreaming was associated with creativity is not a novel one.** ✓ **Your answer is correct**
- ☐ c) **Scientific studies provide corroboration for the connection between dreaming and creativity.**
- ☐ d) **It was Thomas Edison who recognised the connection between dreaming and creativity.**

Q10. The answer to which of the following questions needs to be evaluated to assess the success of the study mentioned in the second para of the passage?

- ☒ a) **Whether the usefulness of the solution to a problem offered by participants can be tangibly compared** ✓ **Your answer is correct**
- ☐ b) **Whether the frequency of dream recall is consistent amongst participants of the study**
- ☐ c) **Whether the creativity evaluation criteria are standardized for all participants**
- ☐ d) **Whether it is possible to detect when participants have entered REM sleep**

Q11. The study conducted by Celia Lacaux most confirms which of the following conclusions?

- ☐ a) **Thomas Edison was right about the connection between dreams and creativity.**
- ☒ b) **Waking up from N1 sleep stage brings out the creativity of individuals while tackling difficult problems.** ✓ **Your answer is correct**
- ☐ c) **The lucid state of mind is the breeding ground for the most innovative ideas.**
- ☐ d) **There is a corelation between creativity and at what stage of sleep one wakes up from.**

Q12. The author believes that 'a relationship between hypnagogia and creativity makes intuitive sense' NOT because:

- ☐ a) Creativity is said to arise out of connections between extremely distant concepts, something that is facilitated by hypnagogia.
- ☐ b) Hypnagogic hallucinations combine details from recent waking experiences with loosely associated memories in novel or unusual ways.
- ☒ c) Mashing up of old and new memories helps eliminate redundant scenarios making us more efficient in exploring unique possibilities. **✗ Your answer is incorrect**
- ☐ d) Hypnagogia is closer to the surface of sleep allowing the dreamer to consciously control the dream and associated memories.

DIRECTIONS for questions 13 to 16: The passage given below is accompanied by a set of **four** questions. Choose the best answer to each question.

Despite its British origin, the political versus legal constitutionalism debate is not confined to the United Kingdom (UK) or its former colonies that adopt Westminster-style parliamentary democracy. This is understandable since constitutions – as the normative underpinning of political processes that frame the relationship between the ruling and the ruled – are inevitably influenced by politics. Leaving aside the technicalities engendered by variations on the power of national apex courts (or the functional equivalents) to scrutinize parliamentary legislation, the political versus legal constitutionalism debate has centred on the role of the court relative to the political branches – especially the legislature – in decisions on constitutional matters.

Notably, political constitutionalism does not set itself apart from legal constitutionalism by taking the view that the constitution comprises whatever results from the balance of political forces, as pre-modern constitutional orders suggest. Instead, political constitutionalists challenge the legalist claim that, as fundamental law, the constitution is to be given authoritative meaning by judicial interpretation in the way in which the court interprets non-constitutional laws. From the political constitutionalist perspective, the meaning of a constitution as the normative framework governing political interaction only manifests itself in the democratic political process with the elected national legislature sitting at the centre. Ultimately, the political versus legal constitutionalism debate comes down to the institutional question of whether the parliament or the court is in a better position to make sense of the constitution and therefore to decide on constitutional matters.

At first glance, this question appears to be another instance of how a normative debate is entangled with institutional choice. It concerns the allocation of power: which institution – the parliament or the court – should be entrusted with the power to render official interpretations of the constitution? Yet, a closer look reveals that what lies beneath the question concerns not only power but also authority: can the state, through its institutions, command loyalty and compliance with the legal precepts from citizens with authority? For political constitutionalists, it is the parliament that legitimates the state's claim to authority thanks to its representative and elective character; for legal constitutionalists, the state's constitutional voice only sounds authoritative when it comes from the judicial bench. In this light, living in a constitutional order means that one obeys the state when the latter decides through its designated constitutional organ that can speak authoritatively. Emerging from this political landscape is a relationship of domination – that is, sovereignty. At its core, the political versus legal constitutionalism debate assumes an institutional conception of sovereignty according to which either the legislative or the judicial institution occupies the seat of sovereignty – that is, the notion of 'organ sovereignty'.

It is true that a political order framed in constitutional terms remains one of sovereignty. So is it that a constitutional order cannot survive without enforcement. Nevertheless, owing to their shared assumption of organ sovereignty, both political and legal constitutionalism fall short in accounting for the dynamics of constitutional ordering and thus render a limited explanation of how law and politics interact constitutionally. Put simply, the assumed organ sovereignty is only a function of a continual dynamic socio-political process that has resulted in constitutional governance.

Q13. Which of the following best describes the concept of 'organ sovereignty'?

- ☐ a) **It is impossible for both political and legal constitutionalism to overlap.**
- ☐ b) **It is impossible to balance power between the legislative and the judicial institutions.**
- ☐ c) **Only one of the legislative and judicial institutions can be truly independent.**
- ☐ d) **Both legal and political constitutionalism aim to make one institute more powerful than the other.**

Q14. Which of the following, if true, weakens the 'legalist claim' mentioned in the second para of the passage?

- ☐ a) **The constitution's authority is definite and isn't based on the judicial interpretation of laws.**
- ☐ b) **The judicial interpretation of laws could undermine the constitution's authority from time to time.**
- ☐ c) **The interpretation of non-constitutional laws by the court could be challenged by legislative institutions.**
- ☐ d) **The courts may update their own interpretation of non-constitutional laws from time to time.**

Q15. Which of the following will the author approve of about 'living in a constitutional order' (third para)?

- ☐ a) **One has to obey the laws made by the state as long as they are ratified by judicial institutions.**
- ☐ b) **One has to follow the interpretation of constitutional law according to the institution occupying the seat of sovereignty.**
- ☐ c) **One obeys laws framed by the constitutional organs of the state.**
- ☐ d) **The judicial processes have to be in line with the democratic processes of the state.**

Q16. Which of the following is a drawback of the 'shared assumption of organ sovereignty' as understood from the passage?

- ☐ a) Neither constitutional organ can achieve complete sovereignty with respect to the other.
- ☐ b) It does not provide a complete explanation of the nature of interaction between the constitutional functions of law and politics.
- ☐ c) It hinders constitutional governance which is dependent on a dynamic socio-political process.
- ☐ d) It stops both political and legal institutions from being designated constitutional authorities.

Q17. DIRECTIONS *for question 17:* The paragraph given below is followed by four summaries. Choose the option that best captures the essence of the paragraph.

Collective statistical illiteracy refers to the widespread inability to understand the meaning of numbers. Statistical literacy is a necessary precondition for an educated citizenship in a technological democracy. Understanding risks and asking critical questions can also shape the emotional climate in a society so that hopes and anxieties are no longer as easily manipulated from outside and citizens can develop a better-informed and more relaxed attitude toward their health.

- ☐ a) **Statistical illiteracy renders the emotional climate in a society vulnerable to manipulation.**
- ☐ b) **Collective statistical illiteracy can make the emotional climate in a society resistant to manipulation by external forces.**
- ☐ c) **Collective statistical literacy can protect a technological society from anxieties that can be easily manipulated by external forces.**
- ☒ d) **Collective statistical literacy can create a technological democracy resilient to external manipulation.** ✖ **Your answer is incorrect**

Q18. DIRECTIONS *for question 18:* The sentences given in the question, when properly sequenced, form a coherent paragraph. Each sentence is labelled with a number. Decide on the proper order for the four sentences and key in the sequence of four numbers as your answer, in the input box given below the question.

- 1. Trained to ensure that even simple advice is backed by evidence, lawyers read closely to the point of comprehension as a matter of professional responsibility.
- 2. The lawyer’s craft sometimes can be boiled down to a willingness to immerse herself within the “fine print,” offering to read what no one else will on account of complexity, length, or sheer dryness.
- 3. Such a skill enables a lawyer to take responsibility for a wider variety of important matters.
- 4. Fledgling startups inevitably have to rely on analysis over experience and lawyers fit well in such situations.

Q19. DIRECTIONS *for question 19:* The paragraph given below is followed by four summaries. Choose the option that best captures the essence of the paragraph.

Much of the research concerning spatial working memory has focused on its independence from other working memory systems. For instance, the influential model of working memory introduced by Baddeley and Hitch (1974) emphasizes the separability of visuospatial and verbal storage mechanisms. Consistent with this model, there is now a substantial body of behavioural and neuropsychological evidence supporting a functional dissociation between spatial and verbal working memory systems. Although the dissection of verbal working memory into its component processes has been productive, a description of the specific mechanisms that mediate spatial working memory has been more elusive.

- ☐ a) **Enough evidence exists for the argument that spatial and verbal working memory mechanisms operate in completely different ways.**
- ☒ b) **While there is evidence to support the delineation of spatial and verbal working memory mechanisms, component processes in the former are less understood than in case of the latter.** ✓ **Your answer is correct**
- ☐ c) **Spatial working memory is based in processes which are more difficult to understand than those of verbal storage mechanisms according to new research.**
- ☐ d) **Neuropsychological evidence confirms the separability of visuospatial and verbal storage mechanisms, despite the lack of information about their component processes.**

Q20. DIRECTIONS *for question 20:* The sentences given in the question, when properly sequenced, form a coherent paragraph. Each sentence is labelled with a number. Decide on the proper order for the four sentences and key in the sequence of four numbers as your answer, in the input box given below the question.

- 1. Numerous studies have found the cognitive factors regarding crowd evacuation behaviors to be significant.
- 2. A video clip captured during the Great East Japan Earthquake involving 48 people in a meeting room gave researchers a unique opportunity to access data that allowed a numerical analysis of evacuation behaviors.
- 3. Because objective data are lacking, the exact effects of these factors have yet to be clarified.
- 4. Using the video clip, researchers discovered a unique evacuation behavior; the decision to either flee or drop was determined by a person’s distance from the exit.

Q21. DIRECTIONS *for questions 21 and 22:* There is a sentence that is missing in the paragraph below. Look at the paragraph and decide in which blank (option 1, 2, 3, or 4) the following sentence would best fit.

Sentence: *By photographing the wing scales of 82 moths from 26 different species using a camera that captures an extra wide spectrum of light, researchers viewed the insects in the infrared: wavelengths of light too long for humans to see.*

Paragraph: ____ (1) _____. Moths' drab gray and brown coats may not capture our imaginations as much as their colorful butterfly cousins do. But, according to a recent study, that's more a failure of human eyesight than of moths themselves. ____ (2) _____. In infrared, the buff and beige wings we are used to seeing flutter around outdoor lights take on vibrant, iridescent colors, the researchers reported in the Journal of the Royal Society Interface. ____ (3) _____. Beyond exposing moths' beauty, the new data also revealed species-specific structural differences in how the insects' wings reflect and scatter infrared light. ____ (4) _____. The diversity of these infrared features could eventually help scientists identify moth species using LIDAR, a tool that emits and senses infrared light.

- ☐ a) Option 1
- ☒ b) Option 2  **Your answer is correct**
- ☐ c) Option 3
- ☐ d) Option 4

Q22. DIRECTIONS *for questions 21 and 22:* There is a sentence that is missing in the paragraph below. Look at the paragraph and decide in which blank (option 1, 2, 3, or 4) the following sentence would best fit.

Sentence: *From the place where the fault ruptures, seismic waves ripple outward in all directions.*

Paragraph: Our planet is covered by tectonic plates that are slowly moving around, pushing into or sliding past one another along boundaries called faults. ____ (1) ____ Friction sometimes causes two of these plates to get stuck to each other at spots along a fault. ____ (2) ____ Tension builds up over years, decades or even centuries until suddenly the fault snaps. ____ (3) ____ The two sides lurch past each other, unleashing an earthquake. ____ (4) ____ . When they reach Earth’s surface, they can set buildings or any other structures shaking – violently and destructively if the quake is strong and close enough.

- ☐ a) Option 1
- ☐ b) Option 2
- ☐ c) Option 3
- ☒ d) Option 4  **Your answer is correct**

Q23. DIRECTIONS *for question 23:* The paragraph given below is followed by four summaries. Choose the option that best captures the essence of the paragraph.

A common misconception about investing in India is that the country is politically homogenous. The truth is that ease of doing business and the pace at which American companies can establish themselves in India is highly dependent on the Indian state in which they want to set up shop. In that sense, India is somewhat like the European Union, where different states offer considerably different experiences. State laws differ in terms of labor law, environmental law, and property laws. This can affect, for example, land acquisition terms for factory construction. So, it is very important, especially for large projects, to be mindful of different state laws.

- ☐ a) **The ease of doing business in India is misunderstood by American companies as it is based on the laws prevalent in the Indian state in which they want to set up shop.**
- ☒ b) **The variations in state laws affects the ease of doing business in India, making it imperative for American companies to understand those before setting up shop here.** ✓ **Your answer is correct**
- ☐ c) **India and European Union are similar in the sense that they are made up of different states with different laws that affect the ease of doing business differently.**
- ☐ d) **The misconception about India's political homogeneity hides the variation in laws across its various states which affects the ease of doing business.**

Q24. DIRECTIONS *for question 24:* The sentences given in the question, when properly sequenced, form a coherent paragraph. Each sentence is labelled with a number. Decide on the proper order for the four sentences and key in the sequence of four numbers as your answer, in the input box given below the question.

1. This was as much a crucial aspect of power relations between coloniser and colonised in the Empire as it was also a dimension of the creation and contestation of imposed identities during and after the end of Empire.

2. Indeed, for most of their history the English themselves had been, not pristinely, but at least somewhat relationally, Anglophone.

3. What we thought of as English before the 19th Century was a hybrid, a mixture of ancient Germanic, Latin and French, let alone the Celtic languages immediately surrounding England.

4. Later, English was relational to all the other languages spoken and written in the British Empire – and many words spoken by Indians, Africans and Native Americans ended up in English.
